G-BA	Gemeinsamer Bundesausschuss (Federal Joint Committee)
HER2	human epidermal growth factor receptor 2
IQWiG	Institut für Qualität und Wirtschaftlichkeit im Gesundheitswesen (Institute for Quality and Efficiency in Health Care)
PT	Preferred Term
SAE	serious adverse event
SGB	Sozialgesetzbuch (Social Code Book)
SOC	System Organ Class

## 1 Background

On 6 June 2023, the Federal Joint Committee (G-BA) commissioned the Institute for Quality and Efficiency in Health Care (IQWiG) to conduct supplementary assessments for Project A23-07 (Trastuzumab deruxtecan – Benefit assessment according to § 35a Social Code Book V) [1].

The commission comprises the assessment of the following data of the DESTINY-Breast04 study subsequently submitted by the pharmaceutical company (hereinafter referred to as the “company”) in the commenting procedure, taking into account the information provided in the dossier [2]:

- analyses excluding patients assigned to gemcitabine treatment before randomization
- analyses of the proportions of patients with concomitant anti-emetic treatment

The responsibility for the present assessment and the assessment result lies exclusively with IQWiG. The assessment is forwarded to the G-BA. The G-BA decides on the added benefit.

## 2 Assessment

Benefit assessment A23-07 [1] used the DESTINY-Breast04 study to assess the added benefit of trastuzumab deruxtecan in comparison with the appropriate comparator therapy (ACT) in patients with unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-low breast cancer who have received prior chemotherapy in the metastatic setting or developed disease recurrence during or within 6 months of completing adjuvant chemotherapy. The DESTINY-Breast04 study is an open-label, randomized, 2-arm study comparing trastuzumab deruxtecan with treatment of physician's choice. Available options for the treatment of physician's choice in the study are the drugs capecitabine, eribulin, gemcitabine, paclitaxel or nab-paclitaxel.

The benefit assessment was based on the results of the total population of the DESTINY-Breast04 study. The benefit assessment addressed, among other things, uncertainties regarding the patients' pretreatment with anthracyclines and/or taxanes, the use of concomitant anti-emetic treatment and the administration of the drug gemcitabine, which is not part of the G-BA's ACT, in the comparator arm. This led, among other things, to a limitation of the certainty of conclusions of the DESTINY-Breast04 study, and the consideration of uncertainties in the certainty of conclusions for the results of individual outcomes. In the context of the commenting procedure, the company submitted analyses of a subpopulation without patients who were assigned to gemcitabine treatment prior to randomization, as well as analyses of the proportions of patients with concomitant anti-emetic treatment [3,4]. These analyses are assessed below in compliance with the commission. In addition, the company provided information on pretreatment with anthracyclines and/or taxanes [4].

### 2.1 Study characteristics

Detailed characteristics of the DESTINY-Breast04 study and of the total study population can be found in dossier assessment A23-07 [1].

#### **Pretreatment of patients with anthracyclines and/or taxanes**

The company stated in its comments that, based on the total study population, 89% of patients in the intervention arm and 87% of patients in the comparator arm had received pretreatment with anthracyclines and/or taxanes. However, the proportions of patients per drug option used in the comparator arm are still not clear from this. Furthermore, there is no separate information on how many patients had received pretreatment with anthracyclines, pretreatment with taxanes, or both treatments before the study. As a result, it is still unclear whether the respective prerequisites of pretreatment with taxanes and/or anthracyclines are fulfilled for the use of the drugs capecitabine, eribulin, paclitaxel and nab-paclitaxel according to the Summary of Product Characteristics (SPC). In addition, the company did not address for how many patients anthracycline or taxane therapy was unsuitable or not an option. It is also

not clear from the data whether patients who received paclitaxel or nab-paclitaxel as comparator therapy had not previously received an anthracycline and/or taxane-containing regimen or whether they were eligible for renewed anthracycline or taxane-containing treatment.

### Use of concomitant anti-emetic treatment

In its comments, the company subsequently submitted new data on the proportions of patients with concomitant anti-emetic treatment in relation to the total population of the DESTINY-Breast04 study (see Table 1).

Table 1: Information on concomitant anti-emetic treatment – RCT, direct comparison: trastuzumab deruxtecan vs. treatment of physician's choice<sup>a</sup>

Study Characteristic Category	Trastuzumab deruxtecan N = 371	Treatment of physician's choice <sup>a</sup> N = 172
<b>DESTINY-Breast04</b>		
Concomitant anti-emetic treatment <sup>b</sup> , n (%)		
Yes	307 (83)	99 (58)
No	64 (17)	73 (42)
<p>a. Capecitabine or eribulin or gemcitabine or paclitaxel or nab-paclitaxel.  b. According to the company, anti-emetic medication is defined as any medication in the ATC class "antiemetics and antinauseants", PTs "dexamethasone" or "prednisolone" in the ATC class "corticosteroids for systemic use", PTs "olanzapine" or "haloperidol" in the ATC class "psycholeptics", or PTs "metoclopramide" or "alizapride" in the ATC class "drugs for functional gastrointestinal disorders". According to the company, additional medications with PT "diphenylhydramine" were defined as anti-emetic medication for paclitaxel.</p> <p>ATC: Anatomical Therapeutic Chemical; n: number of patients in the category; N: number of randomized patients in the safety population; PT: Preferred Term; RCT: randomized controlled trial</p>		

The proportions of patients with concomitant anti-emetic treatment are higher in the subsequently submitted data than those summarized under concomitant anti-emetic treatment in the clinical study report. The company justified the changes by stating that the drugs administered as concomitant medication in the DESTINY-Breast04 study were classified according to the Anatomical Therapeutic Chemical (ATC) code and, as a result, some drugs for the treatment of nausea and vomiting, such as systemic dexamethasone or metoclopramide, were not classified in the category of anti-emetics. According to the company, taking into account all additional therapies given, 83% of patients in the intervention arm and 58% of patients in the comparator arm received concomitant anti-emetic treatment.

There are various uncertainties in the subsequently submitted data. On the one hand, according to the SPC, all patients in the intervention arm should have received concomitant anti-emetic treatment [5]. According to the company, the lower proportion of concomitant

anti-emetic treatment in the intervention arm was due to a gain in knowledge during the study, so that concomitant anti-emetic treatment was only included in version 4.0 of the study protocol. Although this is correct based on the information in the study protocol, it cannot be excluded that the lack of concomitant anti-emetic treatment influences the results of the outcomes of nausea and vomiting (patient-reported and adverse events [AEs]). Furthermore, the information on concomitant anti-emetic treatment refers to all patients included in the study and not only to those for whom concomitant anti-emetic treatment is recommended by the SPC (in the comparator arm only for the administration of eribulin and paclitaxel [6,7]). In addition, for some of the ATC classes considered by the company (e.g. “psycholeptics”), it is not clear whether the drugs named in these classes were used as anti-emetics or for other purposes. In summary, the aspects mentioned continue to limit the certainty of conclusions of the results for the outcomes of nausea and vomiting.

### **Analysis population**

In its comments, the company presented results on patient-relevant outcomes of a subpopulation without those patients who were assigned to gemcitabine treatment before randomization. The company’s subpopulation comprises 344 patients in the intervention arm and 165 patients in the comparator arm. The analyses of this subpopulation are considered in the present addendum. Data on the characteristics of the study population, on treatment duration and observation period, and on subsequent antineoplastic therapies for this subpopulation are not included in the subsequently submitted data of the company.

### **Summary assessment of the certainty of conclusions**

The data on the subpopulation subsequently submitted in the commenting procedure resolved the uncertainties regarding gemcitabine administration mentioned in dossier assessment A23-07. The uncertainties regarding the patients’ pretreatment with anthracyclines and/or taxanes are still present. Overall, however, these are no longer considered sufficient to continue to limit the certainty of conclusions of the DESTINY-Breast04 study.

## **2.2 Results on added benefit**

### **2.2.1 Outcomes included**

The choice of patient-relevant outcomes included in the assessment in the present addendum corresponds to the choice made in dossier assessment A23-07. In the subsequently submitted data, the company presented results on common AEs with cut-off values that deviate from those of the dossier template [8]. This means that only a subset of serious AEs (SAEs) and severe AEs are available. As the subpopulation of patients treated with gemcitabine only represents 9% of the total population, the specific AEs considered in dossier assessment

A23-07 are used in the present situation. A descriptive presentation of common AEs for the relevant subpopulation is not provided in the addendum.

### **2.2.2 Risk of bias**

In comparison with dossier assessment A23-07 [1], the classification in the present addendum does not change for both the risk of bias across outcomes and the outcome-specific risk of bias of the DESTINY-Breast04 study. However, due to the analyses subsequently submitted in the commenting procedure, the certainty of conclusions of the DESTINY-Breast04 study is no longer limited.

### **2.2.3 Results**

Table 2 summarizes the results of the comparison of trastuzumab deruxtecan with treatment of physician's choice in patients with unresectable or metastatic HER2-low breast cancer who have received prior chemotherapy in the metastatic setting or developed disease recurrence during or within 6 months of completing adjuvant chemotherapy.

The Kaplan-Meier curves on the presented time-to-event analyses are presented in Appendix A. No Kaplan-Meier curves are available for the outcome of cardiac disorders (System Organ Class [SOC], severe AEs).

Neutropenia (PT, severe AEs <sup>g</sup> )	343	NA 20 (5.8)	156	NA 23 (14.7)	0.32 [0.17; 0.59]; < 0.001
Nausea (PT, severe AEs <sup>g</sup> )	343	NA 16 (4.7)	156	NA 0 (0)	NC; 0.010

a. Capecitabine or eribulin or paclitaxel or nab-paclitaxel.

b. Hazard ratio calculated using a stratified Cox proportional hazards regression model and the 95% CI using the Wald test. 2-sided p-value based on a stratified log-rank test. The stratification factors were HER2 status, number of prior lines of chemotherapy in the metastatic setting, and hormone receptor/CDK status.

c. A score increase by  $\geq 10$  points from baseline is deemed a clinically relevant deterioration (scale range of 0 to 100).

d. Unclear proportion of patients with missing values at baseline and in the course of the study.

e. A score decrease by  $\geq 15$  points from baseline is deemed a clinically relevant deterioration (scale range of 0 to 100).

f. A score decrease by  $\geq 10$  points from baseline is deemed a clinically relevant deterioration (scale range of 0 to 100).

g. Operationalized as CTCAE grade  $\geq 3$ .

AE: adverse event; CI: confidence interval; CDK: cyclin-dependent kinase; CTCAE: Common Terminology Criteria for Adverse Events; EORTC: European Organisation for Research and Treatment of Cancer; HER2: human epidermal growth factor receptor 2; HR: hazard ratio; n: number of patients with event; N: number of analysed patients; NA: not achieved; NC: not calculable; ND: no data; PT: Preferred Term; QLQ-BR23: Quality of Life Questionnaire-Breast Cancer Module 23; QLQ-C30: Quality of Life Questionnaire-Core 30; RCT: randomized controlled trial; SAE: serious adverse event; SOC: System Organ Class; VAS: visual analogue scale

On the basis of the available information, at most an indication, e.g. of an added benefit, can be derived for the outcome of overall survival, and at most hints can be derived for all other outcomes due to high risk of bias (see Section 2.2.2).

## **Mortality**

### ***Overall survival***

A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for the outcome of overall survival. For this outcome, there is an effect modification by the characteristic of visceral disease (see Section 2.2.4). A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown both for patients with and for patients without visceral disease. The extent of the effect differs between the subgroups. There is an indication of an added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice for patients with and for patients without visceral disease.

## **Morbidity**

### ***Symptoms***

Symptom outcomes were recorded using the instruments European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire-Core 30 (EORTC QLQ-C30) and European Organisation for Research and Treatment of Cancer Quality of Life Questionnaire-Breast Cancer Module 23 (EORTC QLQ-BR23).

#### *EORTC QLQ-C30*

##### *Pain and insomnia*

A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for each of the outcomes of pain and insomnia. There is a hint of an added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice for each of these outcomes.

##### *Nausea and vomiting*

A statistically significant difference to the disadvantage of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for the outcome of nausea and vomiting. There is a hint of lesser benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice for this outcome.

##### *Diarrhoea*

A statistically significant difference to the disadvantage of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for the outcome of diarrhoea. However, the extent of the effect for this outcome of the category of non-serious/non-severe symptoms/late complications was no more than marginal. There is no hint of added benefit

of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

*Fatigue, dyspnoea, appetite loss, and constipation*

No statistically significant difference between treatment groups was shown for any of the outcomes of fatigue, dyspnoea, appetite loss, and constipation. In each case, there is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

*EORTC QLQ-BR23*

*Side effects of systemic therapy, breast symptoms, and arm symptoms*

No statistically significant difference between treatment groups was shown for the outcomes of side effects of systemic therapy, breast symptoms, and arm symptoms. In each case, there is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

*Upset by hair loss*

No suitable data are available for the outcome of upset by hair loss. The proportion of patients with missing values at baseline and in the course of the study is unclear for this scale (one item). There is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

***Health status recorded using the EQ-5D VAS***

No statistically significant difference between treatment groups was shown for the outcome of health status recorded with the EQ-5D VAS. There is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

**Health-related quality of life**

Health-related quality of life outcomes were recorded using the instruments EORTC QLQ-C30 and EORTC QLQ-BR23.

***EORTC QLQ-C30***

*Physical functioning, cognitive functioning, and social functioning*

A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for each of the outcomes of physical functioning, cognitive functioning, and social functioning. There is a hint of an added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice for each of these outcomes.

### *Global health status, role functioning, and emotional functioning*

No statistically significant difference between treatment groups was shown for either of the outcomes of global health status, role functioning, and emotional functioning. In each case, there is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

### **EORTC QLQ-BR23**

#### *Body image*

A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for the outcome of body image. There is an effect modification by the characteristic of age for this outcome (see Section 2.2.4). For patients < 65 years of age, there is a hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice. For patients ≥ 65 years, there is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven for these patients.

#### *Sexual enjoyment*

No suitable data are available for the outcome of sexual enjoyment. The proportion of patients with missing values at baseline and in the course of the study is unclear for this scale (one item). There is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

#### *Sexual functioning and future perspective*

No statistically significant difference between treatment groups was shown for either of the outcomes of sexual functioning and future perspective. In each case, there is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven.

### **Side effects**

#### ***SAEs and severe AEs***

A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for each of the outcomes of SAEs and severe AEs. In each case, there is a hint of lesser harm from trastuzumab deruxtecan in comparison with treatment of physician's choice.

#### ***Discontinuation due to AEs***

No statistically significant difference was found between treatment groups for the outcome of discontinuation due to AEs. There is no hint of greater or lesser harm from trastuzumab deruxtecan in comparison with treatment of physician's choice; greater or lesser harm is therefore not proven.

### **Specific AEs**

#### *Hand-foot syndrome (AEs) and neutropenia (severe AEs)*

A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for each of the outcomes of hand-foot syndrome (AEs) and neutropenia (severe AEs). In each case, there is a hint of lesser harm from trastuzumab deruxtecan in comparison with treatment of physician's choice.

#### *Platelet count decreased, nausea (each severe AEs), gastrointestinal disorders (AEs), and infections and infestations (SAEs)*

A statistically significant difference to the disadvantage of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown for each of the outcomes of platelet count decreased, nausea (each severe AEs), gastrointestinal disorders (AEs), and infections and infestations (SAEs). There is a hint of greater harm from trastuzumab deruxtecan in comparison with treatment of physician's choice for each of these outcomes.

#### *Cardiac disorders (severe AEs)*

The company presented no analyses for the outcome of cardiac disorders (severe AEs) in its comments. Due to the small number of events in the total population (see dossier assessment A23-07 [1]), it cannot be assumed that there is a statistically significant effect in the present subpopulation. There is no hint of greater or lesser harm from trastuzumab deruxtecan in comparison with treatment of physician's choice; greater or lesser harm is therefore not proven.

### **2.2.4 Subgroups and other effect modifiers**

Analogous to the benefit assessment, the following subgroup characteristics are considered in the present addendum:

- age (< 65 years/≥ 65 years)
- visceral disease (yes/no)

The characteristic of sex is disregarded because the total study population includes only 2 men (see dossier assessment A23-07 [1]).

Interaction tests are performed when at least 10 patients per subgroup are included in the analysis. For binary data, there must also be at least 10 events in at least one subgroup.

Only the results with an effect modification with a statistically significant interaction between treatment and subgroup characteristic (p-value < 0.05) are presented. In addition, subgroup results are presented only if there is a statistically significant and relevant effect in at least one

subgroup. Subgroup results where the extent did not differ between subgroups are not presented.

The results are presented in Table 3. The Kaplan-Meier curves on the subgroup results are presented in Appendix A.5.

Table 3: Subgroups (mortality, health-related quality of life) – RCT, direct comparison: trastuzumab deruxtecan vs. treatment of physician's choice<sup>a</sup>

Study Outcome Characteristic Subgroup	Trastuzumab deruxtecan		Treatment of physician's choice <sup>a</sup>		Trastuzumab deruxtecan vs. treatment of physician's choice <sup>a</sup>

d. Interaction term from Cox proportional hazards regression model with treatment, subgroup and interaction between treatment and subgroup as covariates.						
e. A score decrease by ≥ 10 points from baseline is deemed a clinically relevant deterioration (scale range of 0 to 100).						
CI: confidence interval; EORTC: European Organisation for Research and Treatment of Cancer; HR: hazard ratio; n: number of patients with event; N: number of analysed patients; NA: not achieved; NC: not calculable; QLQ-BR23: Quality of Life Questionnaire-Breast Cancer Module 23; RCT: randomized controlled trial						

## **Mortality**

### ***Overall survival***

There is an effect modification by the characteristic of visceral disease for the outcome of overall survival. A statistically significant difference in favour of trastuzumab deruxtecan in comparison with treatment of physician's choice was shown both for patients with and for patients without visceral disease. The extent of the effect differs between the subgroups. There is an indication of an added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice both for patients with and for patients without visceral disease.

### **Health-related quality of life**

#### ***Body image***

There is an effect modification by the characteristic of age for the outcome of body image. A statistically significant difference in favour of trastuzumab deruxtecan was found for patients < 65 years of age, whereas no statistically significant difference between treatment groups was shown for patients ≥ 65 years of age. There is a hint of an added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice for patients < 65 years. For patients ≥ 65 years, there is no hint of added benefit of trastuzumab deruxtecan in comparison with treatment of physician's choice; an added benefit is therefore not proven for these patients.

## **2.3 Probability and extent of added benefit**

The probability and extent of added benefit at outcome level are derived below, taking into account the different outcome categories and effect sizes. The methods used for this purpose are explained in the *General Methods* of IQWiG [9].

The approach for deriving an overall conclusion on the added benefit based on the aggregation of conclusions derived at outcome level is a proposal by IQWiG. The G-BA decides on the added benefit.

### **Determination of the outcome category for symptom outcomes**

Compared with benefit assessment A23-07 [1], there have been no changes in the determination of the outcome category for the symptom outcomes for the present addendum.

#### **2.3.1 Assessment of added benefit at outcome level**

The extent of the respective added benefit at outcome level is estimated from the results presented in Sections 2.2.3 and 2.2.4 (see Table 4).

Table 4: Extent of added benefit at outcome level: trastuzumab deruxtecan vs. treatment of physician's choice<sup>a</sup> (multipage table)

Observation period Outcome category Outcome Effect modifier Subgroup	Trastuzumab deruxtecan vs. treatment of physician's choice <sup>a</sup> Median time to event (months) or proportion of events (%) Effect estimation [95% CI]; p-value Probability <sup>b</sup>	Derivation of extent <sup>c</sup>

a. Capecitabine or eribulin or paclitaxel or nab-paclitaxel. AE: adverse event; EORTC: European Organisation for Research and Treatment of Cancer; QLQ-BR23: Quality of Life Questionnaire-Breast Cancer Module 23; QLQ-C30: Quality of Life Questionnaire-Core 30; SAE: serious adverse event	

Overall, there are both positive and negative effects of different extents for trastuzumab deruxtecan in comparison with treatment of physician's choice. Only for overall survival are the observed effects based on the entire observation period. For the outcome categories of morbidity, health-related quality of life and side effects, however, they are based exclusively on the shortened observation period of approx. 4.5 months (morbidity, health-related quality of life) and 40 days (side effects) after the end of treatment with the study medication.

For the outcome of overall survival, an effect modification by the characteristic of visceral disease was shown. There is an indication of minor added benefit for patients with visceral disease, and an indication of major added benefit for patients without visceral disease for the outcome of overall survival. Due to this effect modification, the added benefit is derived separately for patients with and without visceral disease.

For non-serious/non-severe symptoms/late complications, as well as for non-serious/non-severe side effects, both positive and negative effects of trastuzumab deruxtecan of different extents, each with the probability of a hint, were shown for all patients. For health-related quality of life, there are exclusively positive effects in several outcomes with the extents "minor" to "considerable". For the severe/serious side effects, there is, among others, a positive effect in the overall rate of SAEs and severe AEs with the extents "minor" and "major". However, there are also negative effects in several severe specific AEs with the extents "minor" or "non-quantifiable".

Overall, the positive effects prevail, so that the negative effects do not call into question the minor or major extent of added benefit in the outcome of overall survival. In summary, the added benefit for patients with unresectable or metastatic HER2-low breast cancer who have received prior chemotherapy in the metastatic setting or developed disease recurrence during or within 6 months of completing adjuvant chemotherapy is derived as follows: In comparison with treatment of physician's choice, there is an indication of minor added benefit of trastuzumab deruxtecan for patients with visceral disease, and an indication of major added benefit for patients without visceral disease.

## 2.4 Summary

The data subsequently submitted by the company in the commenting procedure have changed the conclusion on the added benefit of trastuzumab deruxtecan from dossier assessment A23-07: In comparison with treatment of physician's choice, there is an indication of minor added benefit of trastuzumab deruxtecan for patients with visceral disease, and an indication of major added benefit for patients without visceral disease.

Table 6 below shows the result of the benefit assessment of trastuzumab deruxtecan, taking into account dossier assessment A23-07 and the present addendum.

Table 6: Trastuzumab deruxtecan – probability and extent of added benefit

Therapeutic indication	ACT <sup>a</sup>	Probability and extent of added benefit
Adults <sup>b</sup> with unresectable or metastatic HER2-low breast cancer who have received prior chemotherapy in the metastatic setting or developed disease recurrence during or within 6 months of completing adjuvant chemotherapy <sup>c</sup>	<ul style="list-style-type: none"> <li>▪ Capecitabine or</li> <li>▪ eribulin or</li> <li>▪ vinorelbine or</li> <li>▪ an anthracycline or taxane-containing regimen (only for patients who have not yet received an anthracycline and/or taxane-containing regimen or who are eligible for renewed anthracycline or taxane-containing treatment)</li> </ul>	<ul style="list-style-type: none"> <li>▪ Patients with visceral disease: indication of minor added benefit<sup>d</sup></li> <li>▪ Patients without visceral disease: indication of major added benefit<sup>d</sup></li> </ul>
<p>a. Presented is the respective ACT specified by the G-BA.</p> <p>b. According to the G-BA, the evidence on treatment options for men with breast cancer is extremely limited. According to the guidelines, the recommendations for the treatment of men are predominantly based on the recommendations for the treatment of women. Within the framework of the benefit assessment, separate consideration of men can be useful.</p> <p>c. The therapeutic indication may also include patients who are candidates for further endocrine therapy. According to the G-BA, it is assumed that the endocrine treatment options for patients with hormone receptor-positive breast cancer have been exhausted in the present treatment situation. It is also assumed according to the G-BA that, as part of prior therapy, patients typically received taxane and/or anthracycline-containing chemotherapy. Moreover, it is assumed that (secondary) resection or radiotherapy with curative intent is not indicated. According to guideline recommendations, combination therapy should be considered for patients with high remission pressure due to severe symptoms or rapid tumour growth.</p> <p>d. Only patients with an ECOG PS of 0 or 1 and 2 male patients were included in the DESTINY-Breast04 study. It remains unclear whether the observed effects can be transferred to patients with ECOG PS <math>\geq 2</math> and to male patients.</p> <p>ACT: appropriate comparator therapy; ECOG PS: Eastern Cooperative Oncology Group Performance Status; G-BA: Federal Joint Committee; HER2: human epidermal growth factor receptor 2</p>		

The G-BA decides on the added benefit.
