TABLE OF CONTENTS

	Page
COVER PAGE	1
STUDY CO-ORDINATION, MANAGEMENT AND REPORTING	2
TABLE OF CONTENTS	10
LIST OF ABBREVIATIONS AND TERMS	21
SYNOPSIS	22
1. INTRODUCTION	29
2. STUDY OBJECTIVES	31
3. INVESTIGATIONAL PLAN	31
3.1 Study Design and Plan - Description and Rationale	31
3.1.1 OVERVIEW AND JUSTIFICATION	31
3.1.2 PROTOCOL AMENDMENTS	32
3.2 Ethics	33
3.2.1 ETHICS COMMITTEE	33
3.2.2 PATIENT INFORMATION	33
3.3 Study Population	34
3.3.1 INCLUSION CRITERIA	34
3.3.2 EXCLUSION CRITERIA	34
3.3.3 WITHDRAWAL CRITERIA	35
3.3.4 SAMPLE SIZE - NUMBER OF PATIENTS PLANNED	36
3.4 Treatments	36
3.4.1 TREATMENTS TO BE COMPARED	36
3.4.2 IDENTITY OF TEST TREATMENTS	36
3.4.3 DOSE SELECTION AND TIMING	37
3.4.4 METHOD OF ASSIGNING PATIENTS TO TREATMENT GROUPS	37
3.4.5 TREATMENT SUPPLY AND BLINDING	37
3.5 Treatment Procedures	38
3.5.1 CONCOMITANT THERAPY	38
3.5.2 TREATMENT ACCOUNTABILITY AND COMPLIANCE	38
3.6 Efficacy and Safety Variables	39
3.6.1 EFFICACY	39
3.6.1.1 Hamilton Depression Rating Scale	39
3.6.1.2 Clinical Global Impression	41
3.6.1.3 Montgomery and Asberg Depression Rating Scale	41
3.6.1.4 Geriatric Depression Rating Scale	42
3.6.2 SAFETY	42
3.6.2.1 Adverse Events	43

Pharmacia

Document 9550089

3.6.2.2 Clinical and Laboratory Tests	44
3.7 Study Procedures and Flow Chart	46
3.7.1 SCHEDULE OF ASSESSMENTS	46
3.7.2 PROCEDURES AT EACH VISIT	46
3.8 GCP Compliance, Data Quality Assurance	47
3.9 Statistical Analysis	47
3.9.1 SAMPLE SIZE CONSIDERATIONS	47
3.9.2 STATISTICAL AND ANALYTICAL PLANS	48
3.9.2.1 Baseline Comparability of Treatment Groups	48
3.9.2.2 Efficacy Analyses	48
3.9.2.3 Safety	49
3.9.2.4 Changes in the Conduct of the Study or Planned Analysis	51
3.10 Data Management	52
4. STUDY PATIENTS	53
4.1 Disposition of Patients	53
4.2 Protocol Deviations	54
4.3 Demographic Data and Psychiatric Anamnesis	56
4.3.1 COGNITIVE FUNCTION	57
4.3.2 DIAGNOSIS AND HISTORY OF THE DEPRESSIVE DISORDER	57
4.3.3 SEVERITY OF DEPRESSION	58
4.3.4 PREVIOUS ANTIDEPRESSANT TREATMENTS	60
4.3.5 MEDICAL HISTORY	61
5. STUDY MEDICATION AND COMPLIANCE	62
6. CONCOMITANT MEDICATIONS	64
7. EFFICACY RESULTS	66
7.1 Hamilton Depression Rating Scale	66
7.2 Clinical Global Impression	68
7.2.1 SEVERITY OF ILLNESS	68
7.2.2 GLOBAL IMPROVEMENT	68
7.2.3 EFFICACY INDEX	70
7.3 Montgomery and Asberg Depression Rating Scale	70
7.4 Geriatric Depression Rating Scale	70
7.5 Efficacy Conclusions	71

8. SAFETY RESULTS	72
8.1 Safety Population and Extent of Exposure	72
8.1.1 NUMBER OF PATIENTS IN SAFETY ANALYSIS	72
8.1.2 TOTAL DRUG EXPOSURE	72
8.2 Adverse Events	72
8.2.1 ANALYSIS OF ADVERSE EVENTS	72
8.2.1.1 End-Point Analysis	73
8.2.1.2 Absolute and Per Cent Frequency	73
8.2.1.3 Occurrence	75
8.2.1.4 Cumulative Risk for Individual Events	76
8.2.1.5 Dose Relationship	76
8.2.1.6 Maximal Severity	76
8.2.1.7 Duration	77
8.2.1.8 Symptomatic Treatment	77
8.2.1.9 Modification of Study Medication and Patient Outcome	77
8.2.1.10 Prevalence	78
8.2.1.11 Relationship Between Adverse Events and Study Medication	79
8.2.1.12 Adverse Events Occurred in Patients with Creatinine Clearance <30 ml/min	79
8.2.2 ADVERSE EVENT SUMMARY	80
8.2.2.1 Severity of Adverse Events	80
8.2.2.2 Age- and Gender-Related Effects	80
8.2.2.3 Frequently Reported Adverse Events	81
8.2.3 SERIOUS ADVERSE EVENTS, DEATHS AND ADVERSE EVENTS ASSOCIATED WITH WITHDRAWAL	84
8.2.3.1 Serious Adverse Events and Deaths	84
8.2.3.2 Adverse Events Associated with Withdrawal	84
8.3 Laboratory Tests	88
8.3.1 SUMMARY STATISTICS OF LABORATORY VALUES	88
8.3.2 URINALYSIS	88
8.3.3 ABNORMAL LABORATORY VALUES	88
8.3.4 ABNORMAL LABORATORY VALUES OF CLINICAL RELEVANCE	89
8.4 Vital Signs	89
8.4.1 BLOOD PRESSURE AND HEART RATE	89
8.4.2 BODY WEIGHT	90

Pharmacia

Document 9550089

Name of Company: Pharmacia Spa Name of finished product: Name of active ingredient(s): Reboxetine	Individual study table referring to part IV of the dossier Ref.: Vol.: Page:	(For national authority use only)
Publication (reference): None		
Study period: September 1992 - May 1994	Clinical Phase: III	
Objectives: To assess the tolerability and activity of reboxetine in comparison with imipramine in elderly patients suffering from Depressive Disorders.		
Methodology: In this prospective, double-blind, randomised, controlled, parallel group, multicentre and multinational trial, patients underwent an initial wash-out period of 4-28 days (≥ 3 weeks in case of fluoxetine administration) after which they received reboxetine 2 mg b.i.d. or imipramine 75 mg/day (25 mg in the morning and 50 mg in the evening) for eight weeks (imipramine was given at a dose of 25 mg b.i.d. for the first three days of the study). At the end of the initial 3 weeks' treatment, patients could be switched to a higher dose regimen, corresponding to 6 mg/day reboxetine and 100 mg/day imipramine up to the end of treatment. Patients willing to continue after completion of 8 weeks' treatment were maintained on the same medication until the last patient recruited had completed the study and all the CRFs had been collected. The response to treatment was assessed using the Hamilton Depression Rating scale (HAMD), Clinical Global Impression (CGI), Montgomery and Asberg Depression Rating Scale (MADRS) and the Geriatric Depression Rating Scale (GDS). Safety and tolerability were assessed by the reporting of any adverse events and assessment of vital signs (supine and standing blood pressure and heart rate), laboratory tests, and ECG.		
Number of subjects (planned and analysed): Three hundred patients were to be recruited in the study. Three hundred and forty-seven patients from 46 centres were randomised to treatment with either reboxetine (176) or imipramine (171).		
Diagnosis and main criteria for inclusion: Patients were diagnosed according to the DSM-III-R classification. The severity of depression was evaluated using the HAMD scale. Criteria for inclusion were as follows: (1) Patients of either sex, of any race, aged over 65 years, with a diagnosis of Major Depressive Episodes or Dysthymia, not accompanied by psychotic features (DSM-III-R); (2) Initial (pre-treatment) total score for the 21-item HAMD ≥ 18 and the total score for Mini Mental Status (MMS) ≥ 22 .		
Test product: capsules containing reboxetine methanesulphonate tablets Unit dose: 2 mg or 4 mg (two 2 mg tablets) of reboxetine (free base) Mode of administration: by oral route, b.i.d. Batch no.: SF1308, A06G01 (2 mg); SF1264, A06G02 (4 mg)		
Duration of treatment: 8 weeks		
Reference therapy: Indistinguishable capsules containing imipramine tablets Unit dose: 25 or 50 mg imipramine Mode of administration: by oral route, b.i.d. Batch no.: SF1321, A27G01 (25 mg); SF1265, SF1323, SF1353, A27G02 (50 mg)		
Criteria for evaluation: Efficacy Difference of HAMD total score at last assessment vs baseline, frequency of patients who achieved response (HAMD total score decrease $\geq 50\%$ vs baseline value) or remission (HAMD total score ≤ 10 as absolute value), frequency of clinical improvement scored as 'much to very much improved' on the CGI-Global Improvement were evaluated. HAMD total scores and factor scores, MADRS total scores, GDS total scores and CGI classification.

Document 9550089

<p>Name of Company: Pharmacia Spa</p> <p>Name of finished product:</p> <p>Name of active ingredient(s): Reboxetine</p>	<p>Individual study table referring to part IV of the dossier</p> <p>Ref.:</p> <p>Vol.:</p> <p>Page:</p>	<p>(For national authority use only)</p>
<p>Results</p> <p>Three hundred and forty-seven patients (263 females and 84 males, with a mean age of 73.8 years) entered the study. During the study, 176 patients received reboxetine (109 in the MDD stratum; 67 in the DYS stratum), and 171 imipramine (109 in the MDD stratum; 62 in the DYS stratum). One hundred and twenty-seven reboxetine and 126 imipramine recipients completed the study, while 49 (27.8%) and 45 (26.3%) dropped out of the study, respectively. Newly emerged adverse events or intercurrent illnesses were the main reasons for discontinuation in 20 (11.4%) and 27 (15.8%) patients of the reboxetine and imipramine groups, respectively. In the MDD subgroup of patients, the difference in drop-out rate for adverse events between the two treatment groups was maximal (12.8% on reboxetine and 19.3% on imipramine), while in the DYS subpopulation the drop-out rate for adverse events was similar in the two treatment groups (9.0% and 9.7%, respectively).</p>		
<p>Efficacy</p> <p>The mean HAM-D total score was reduced from 26.6 at Day 0 to 14.8 at last assessment in the 172 patients treated with reboxetine who had at least one assessment in addition to baseline and to 11.4 at Day 56 in the 127 patients who completed the study. In the 168 patients who were treated with imipramine, with at least one assessment in addition to baseline, the mean HAM-D total score was reduced from 26.1 at Day 0 to 12.9 at last assessment and to 8.8 at Day 56 in the 126 patients who completed the study. The difference between the two treatments in the mean HAM-D decrease at last assessment was of -1.5 points (95% CI, -3.6 ÷ 0.6 points). Similarly, in the MDD subgroup of patients, this difference was of -0.4 points (95% CI, -3.2 ÷ 2.4 points), while in the DYS subpopulation the difference was in favour of imipramine (-3.4 points; 95% CI, -6.5 ÷ -0.2 points).</p> <p>At last assessment, 54.1% of the reboxetine-treated patients and 56.5% of the imipramine-treated patients were classified as responders, while 42.4% and 49.4%, respectively, were seen to be in remission. A similar pattern of response and remission rate was observed in the MDD subpopulation, whilst there was a higher proportion of patients classified as responders and in remission on imipramine than on reboxetine in the DYS subpopulation.</p> <p>The analysis of the 17 specific items of the HAM-D scale at baseline showed that the proportion of patients eventually in remission was higher among the less severe cases (minimum score level) at baseline for the vast majority of items. For few items the frequency of patients eventually in remission was particularly low among severely ill (maximum score level) patients at baseline. This occurred in both treatment groups for Insomnia Middle, Agitation and, mainly in the reboxetine group, for Hypochondriasis. In all cases, the prevalence of severely ill patients at admission was higher in the reboxetine than in the imipramine group. These results were consistent in the diagnostic subpopulations, but extreme differences were observed in the DYS subgroup, particularly for Agitation and Hypochondriasis.</p> <p>At last assessment, the percentage of patients who were 'much to very much improved' (CGI - Global Improvement) was similar in both groups (56.9% in the reboxetine group and 59.4% in the imipramine group). The between treatment difference at last assessment was -2.5% (95% CI, -12.9% ÷ 7.9%).</p> <p>In the MDD subgroup of patients, the proportion of patients judged 'much to very much improved' at last assessment was slightly higher on reboxetine than on imipramine (58.9% vs 52.3%). The between treatment difference at last assessment was 6.6% (95% CI, -6.0% ÷ 19.8%). On the contrary, in the DYS subpopulation, the proportion of 'much to very much improved' patients was higher on imipramine than on reboxetine (72.1% vs 53.7%) and the between treatment difference at last assessment was -18.4% (95% CI, -34.8% ÷ -2.0%).</p> <p>The proportion of cases with moderate to marked efficacy in absence of side-effects (CGI - Efficacy Index: 3 to 4) was similar on reboxetine and on imipramine in the total patients sample. While in the MDD subpopulation, this proportion was slightly higher on reboxetine (40.2%) than on imipramine (34.9%), in the DYS subgroup this condition was judged to be present in 52.5% of the patients on imipramine vs 38.8% of those on reboxetine. The mean total MADRS score was reduced from 29.7 at Day 0 to 15.5 at last assessment in the 171 reboxetine</p>

<p>Name of Company: Pharmacia Spa</p> <p>Name of finished product: Reboxetine</p> <p>Name of active ingredient(s): Reboxetine</p>	<p>Individual study table referring to part IV of the dossier</p> <p>Ref.:</p> <p>Vol.:</p> <p>Page:</p>	<p>(For national authority use only)</p>
<p>Efficacy (continued)</p> <p>group patients who had at least one assessment in addition to baseline, and to 11.7 in the 128 patients who had the assessment at Day 56. In patients treated with imipramine, values changed from 30.0 at Day 0 to 14.0 at last assessment (168 patients), and to 8.9 at Day 56 (126 assessed patients). A slightly higher reduction of the total score was observed on imipramine (from 27.9 to 9.8) than on reboxetine (from 28.0 to 14.6) in the DYS subpopulation.</p> <p>The mean total GDS score was reduced from 23.1 at Day 0 to 14.0 at last assessment in the 172 reboxetine group patients with at least one assessment in addition to baseline, and to 11.4 in the 128 reboxetine patients who had the assessment at Day 56. In patients treated with imipramine, values changed from 23.4 at Day 0 to 12.9 at last assessment (168 patients), and to 9.2 at Day 56 (125 assessed patients). As above, in the DYS subpopulation the reduction of the total score at last assessment was slightly higher on imipramine (from 22.9 to 9.9) than on reboxetine (from 23.0 to 13.6).</p> <p>The results of the additional analyses on the MDD and DYS sub-populations indicate that both treatments were similarly effective in terms of improvement of the clinical picture in patients diagnosed as having a Major Depressive Episode/Disorder, while in dysthymic patients imipramine was more effective than reboxetine in terms of frequency and extent of improvement.</p>		
<p>Safety:</p> <p>All the patients who received study treatment were included in the safety analysis, i.e. 347 patients (176 reboxetine, 171 imipramine).</p> <p>The occurrence of newly reported adverse events was similar in both groups during the study: 120/176 (68.2%) reboxetine group patients reported 307 adverse events compared with 122/171 (71.3%) imipramine patients who reported 338 adverse events. The relative chance of developing at least one adverse event, as estimated by the OR, was similar in the two treatment groups [OR= 0.86 (95% CI, 0.55 ÷ 1.36)]. However, in the MDD subgroup, the relative chance of adverse events was slightly higher on imipramine than on reboxetine [OR= 0.70 (95% CI, 0.39 ÷ 1.26)], while in the DYS subpopulation, the relative chance was slightly higher on reboxetine than on imipramine [OR= 1.20 (95% CI, 0.57÷2.55)].</p> <p>The proportion of patients with adverse events in the different weeks of treatment was slightly higher on imipramine than on reboxetine. This difference was more evident in the MDD subpopulation, while in the DYS subgroup the prevalence of adverse events was higher on reboxetine than on imipramine during the initial 4 weeks of treatment.</p> <p>Discontinuation due to a newly emerged adverse event was more frequent on imipramine (15.8%) than on reboxetine (11.4%), mainly in the MDD subgroup of patients (19.3% on imipramine vs 12.8% on reboxetine).</p> <p>On the whole, the frequency of individual events was very similar in the reboxetine and imipramine group with the exception of insomnia, more frequent on reboxetine (6% vs 3%) and of hypotension and related symptoms, more frequent on imipramine (16% vs 7%). Hypotension and related symptoms showed a risk of development significantly higher on imipramine than on reboxetine. This latter result was confirmed in the MDD subgroup and not in the DYS subpopulation.</p> <p>In patients with or without cardiovascular disorders at admission, the frequency of cardiovascular adverse events was higher on imipramine than on reboxetine. However, while the presence of cardiovascular disorders at baseline seemed not to facilitate the emergence of cardiovascular adverse events and, in particular, of hypotension and related symptoms, on reboxetine, patients on imipramine suffered from newly emerged cardiovascular adverse events and, in particular, of hypotension and related symptoms, more frequently when affected by cardiovascular disorders at baseline (26% and 21%, respectively) than when not affected (17% and 12%, respectively). The differences in favour of reboxetine are mainly evident in the former population (12%</p>

Document 9550089

<p>Name of Company: Pharmacia Spa</p> <p>Name of finished product:</p> <p>Name of active ingredient(s): Reboxetine</p>	<p>Individual study table referring to part IV of the dossier</p> <p>Ref:</p> <p>Vol.:</p> <p>Page:</p>	<p>(For national authority use only)</p>
<p>Safety (continued):</p> <p>vs 26% for cardiovascular adverse events and 5% vs 21% for hypotension and related symptoms).</p> <p>Moderate or severe adverse events were somewhat more frequent on imipramine than on reboxetine (73% vs 65%).</p> <p>Males and females suffered from adverse events with similar frequency on reboxetine and on imipramine. The most relevant between-gender difference was related to the frequency of hypotension and related symptoms, which were complained of mainly by male patients in both treatment groups (22.2% of male patients vs 13.5% of female patients on imipramine; 10.3% of male patients vs 6.6% of female patients on reboxetine) and urinary hesitancy/retention, which was complained of mainly by male patients in both treatment groups (15.6% of male patients vs 2.4% of female patients on imipramine; 10.3% of male patients vs 2.2% of female patients on reboxetine). Increased sweating was complained of mainly by female patients in both treatment groups (10.9% of female patients vs 2.6% of male patients on reboxetine; 10.3% of female patients vs 4.4% of male patients on imipramine). Dry mouth was complained of mainly by female patients on reboxetine (24.8% of female patients vs 12.8% of male patients).</p> <p>The proportion of patients complaining of at least one adverse event with probable to definite relationship was somewhat higher on imipramine (43%) than on reboxetine (33%).</p> <p>One patient died (suicide) during the study period. Three further patients died (bronchopneumonia, pulmonary edema and apoplexy) 12, 6 and 11 days respectively after the end of the study. All deaths were on imipramine. Twelve serious adverse events were reported, 2 on reboxetine (meningioma, acute confusional state and fall) and 10 on imipramine (postural hypotension, sudden faint, atrial fibrillation, right bundle branch block and A-V block first degree, 2 cases of fracture of the neck of the femur, fall and fracture of the knee, convulsive episode, drowsy and jerky movements in legs and urinary retention).</p> <p>There was no indication of modifications in laboratory tests that was of clinical significance.</p> <p>As for vital signs, major differences between reboxetine and imipramine were observed in the absolute frequency of clinically relevant decrease of diastolic blood pressure, higher on imipramine than on reboxetine on standing (22% and 13% of evaluated patients, respectively) and in the frequency of relevant increase of diastolic blood pressure, slightly higher in the reboxetine group on lying (13% and 7% of evaluated patients, respectively). The vast majority of relevant decreases and increases were reported once during the study.</p> <p>Lying and standing heart rate increased during treatment to values ≥ 100 beats/min in a slightly higher proportion of patients on reboxetine than on imipramine particularly on standing (12% vs 6%). However, the majority of those relevant increases occurred occasionally (reported once).</p> <p>Newly emerged abnormalities in ECG recordings were mainly related to rhythm disorders (11.7% and 6.4% in the reboxetine and imipramine group, respectively) and conduction disorders (6.0% and 3.9% in the reboxetine and imipramine group, respectively). However, in all cases the proportion of patients with newly emerged abnormalities was consistently lower than the proportion of normalised cases.</p>		

Pharmacia

Document 9550089

Name of Company: Pharmacia Spa Name of finished product: Name of active ingredient(s): Reboxetine	Individual study table referring to part IV of the dossier Ref: Vol: Page:	(For national authority use only)
Conclusions: The efficacy of reboxetine therapy in elderly patients suffering from Depressive Disorders, as evaluated by the improvement of HAM-D, CGI, MADRS, and GDS scales, was not different from that of imipramine. This was particularly the case in the MDD subpopulation, while in the DYS subpopulation, the frequency and extent of improvement was higher on imipramine than on reboxetine. This finding could be connected with imbalances between the two treatment groups at baseline for the somatic component of the psychopathology, more severe in the reboxetine group, rather than with a diagnostic specificity. The overall tolerability of reboxetine was highly acceptable, as shown in the minimal modification of vital signs, haematology and blood chemistry tests, and ECG examinations. The overall frequency of adverse events was similar on reboxetine and imipramine, thus not allowing the rejection of the hypothesis of equal tolerability of reboxetine and imipramine as stated in the protocol. However, the frequency of moderate to severe adverse events and of serious adverse events, the frequency of patients with probable to definite adverse events and the discontinuation rate in view of adverse events were higher on imipramine than on reboxetine. In addition, the rate of occurrence of cardiovascular disorders, in particular hypotension and related symptoms, was significantly lower on reboxetine than on imipramine.		

090177e1803f200f\Approved\Approved On: 12-Nov-2002 22:22

1. INTRODUCTION

Reboxetine (FCE 20124 or (2 RS, α RS)-2-[α -(2-ethoxy-phenoxy) benzyl] morpholine) is a new chemical compound which is highly potent in the pharmacological and biochemical tests predictive of antidepressant efficacy such as reserpine antagonism, norepinephrine re-uptake inhibition and REM sleep latency increase [1]. Reboxetine also demonstrates the ability to prevent the effects of clonidine, an α_2 noradrenergic receptors agonist, after a single oral dose in an animal model where tricyclic antidepressants were active only upon repeated administration [1]. Therefore, reboxetine was hypothesized to exert antidepressant efficacy of faster onset than the antidepressants currently available in depressed patients. In addition, comparison with imipramine 75 mg in healthy volunteers revealed that reboxetine does not possess the marked sedative activity of imipramine, but rather psychostimulating properties [2, 3].

The pharmacokinetic properties of reboxetine were evaluated in healthy volunteers [4]. Average peak levels were observed at 2 hours after oral administration, with remarkably stable levels 1-6 hours after administration; its plasma half-life was estimated as 13.2 hours and 73% of the AUC following an oral dose was accounted for by unchanged reboxetine.

An early phase II, 4-week, multicentre study in 98 patients, in which reboxetine was administered at fixed-changing doses with maximum doses of between 4 and 12 mg, showed that it was well tolerated at doses of up to 10 mg/day [5].

A double-blind, parallel, multicentre study in 258 patients hospitalised due to a major depressive episode compared maximum doses of 8 mg reboxetine with 200 mg of desipramine and placebo over a period of 4 weeks [6]. Reboxetine was found to be more effective than placebo with decreases of $\geq 50\%$ in Hamilton Depression Rating Scale (HAMD) at the end of treatment in 63% of patients compared with 36% for placebo and 46% for desipramine. These decreases were present after 14 days of treatment in 31% of reboxetine patients and 22% of desipramine patients. More reboxetine patients complained of headache and urinary retention, whereas more desipramine patients experienced dry mouth, sweating and blurred vision. Cardiovascular adverse events were relatively rare and appeared with slightly higher frequency in the desipramine group (hypotension and tachycardia).

Phase II results obtained in controlled conditions in patients suffering from Major Depressive Disorders indicate that reboxetine is an effective antidepressant agent with a favourable therapeutic index with respect to desipramine.

An open, scaling-up, repeated doses study was carried out in 12 elderly patients suffering from Depressive Disorders [7] in order to evaluate the activity, tolerability and pharmacokinetics of reboxetine administered for 4 weeks at daily doses, increased at weekly intervals, from 1 to 4 mg b.i.d. The pharmacokinetic results indicated dose-

Pharmacia

Document 9550089

proportionality over the explored range, and C_{max} and AUC_{0-12h} higher than those found in healthy young subjects who had received reboxetine in the same dose range. The maximum foreseen dose of 4 mg b.i.d. was well tolerated in 8 out of 9 elderly patients exposed. However, the attainment of this dose was prevented in 3 patients because of the emergence of cardiac rhythm acceleration or other rhythm disorders. The results of this study suggested that daily doses of 2 to 3 mg b.i.d. should have been used in subsequent controlled studies of the antidepressant efficacy and tolerability of reboxetine in the elderly population. This present study was designed to collect comparative evidence of reboxetine's safety and efficacy vs the tricyclic antidepressant imipramine in elderly patients with Depressive Disorders and to extend information obtained from other controlled studies [8, 9].

2. STUDY OBJECTIVES

To assess the tolerability and activity of reboxetine in comparison with imipramine in elderly patients suffering from Depressive Disorders.

3. INVESTIGATIONAL PLAN

3.1 Study Design and Plan - Description and Rationale

3.1.1 OVERVIEW AND JUSTIFICATION

This phase III study was designed as a prospective, double-blind, randomised, controlled, parallel-group, multicentre trial. Its aim was to compare the tolerability and efficacy of reboxetine with that of imipramine, administered orally for 8 weeks, in elderly patients with Depressive Disorders. The design of the study is shown overleaf.

A total of 300 elderly patients affected by a Major Depressive Episode/Disorder or Dysthymia (DSM-III-R) was to be recruited in accordance with the inclusion and exclusion criteria, and an informed consent obtained from each patient prior to screening.

At screening, a full medical history and physical examination, including chest X-ray or pulmonary function test and electrocardiogram (ECG), were carried out and vital signs and laboratory values were measured. Patients were classified according to the DSM-III-R classification and their cognitive function was evaluated by the Mini Mental State Examination scale (MMS). The severity of depression was evaluated using the Hamilton Depression (HAMD) and Clinical Global Impression (CGI) rating scales.

After an initial wash-out period of 4-28 days, patients were randomised to treatment with either reboxetine or imipramine according to a randomisation list balanced within centre and stratified for the two subpopulations of Major Depressive Episode/Disorder (MDD) and Dysthymia (DYS). Treatments consisted of oral reboxetine 2 mg b.i.d., or oral imipramine 25 mg in the morning and 50 mg in the evening (imipramine was given at a dose of 25 mg b.i.d. for the first three days of the study) for 8 weeks. In the case of inefficacy or unsatisfactory response, combined with good tolerability, after 3 weeks of treatment, the total daily dose was allowed to increase up to 6 mg/day for reboxetine and 100 mg/day for imipramine for the remaining 5 weeks of the study. In those patients who then displayed poor tolerance at this increased dose, the dose was reduced to the previously well tolerated level.

This study was primarily a safety assessment of reboxetine compared with imipramine in elderly patients. Safety and tolerability were assessed by the reporting of any adverse events and measurements of vital signs (blood pressure and heart rate, supine and standing), ECG and laboratory tests.

Pharmacia

Document 9550089

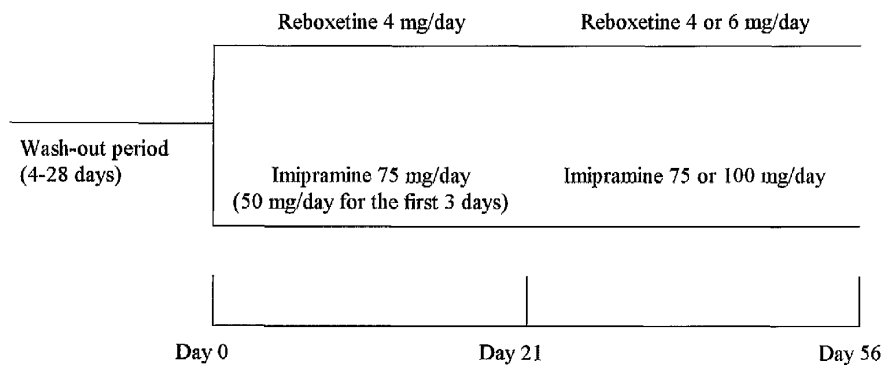

Additionally, efficacy was evaluated by the HAMD total score decrease vs Day 0 at last assessment and by the response (a decrease of at least 50% in the total HAMD score) and remission (a total HAMD score of 10 or less, absolute value) rate at last assessment. The improvement of clinical picture of Clinical Global Impression - Global Improvement, scored as 'very much improved' or 'much improved', at last assessment vs Day 0 was considered to be an index of response.

Other variables used for evaluating efficacy were the Montgomery and Asberg Depression Rating Scale (MADRS) and Geriatric Depression Rating Scale (GDS).

Patients willing to continue receiving the test treatment after completion of the 8-week treatment period were maintained on the same medication under blind conditions until the completion of the last patient in the study and collection of the Case Record Forms (CRFs).

A follow-up visit was to be carried out for each patient one month after treatment discontinuation in order to monitor possible withdrawal reactions and collect information on any events since treatment discontinuation.

A copy of the final protocol can be found in Appendix 12.1.1.

3.1.2 PROTOCOL AMENDMENTS

There were no protocol amendments which were valid for all the countries involved in the study. There were, however, amendments required by local Ethics Committees in Australia, France and UK. In Australia, there were two amendments: the first amendment modified the exclusion criterion for the presence of kidney disease, increasing the minimum of creatinine clearance of 30 ml/min to 50 ml/min for the definition of moderate to medium renal impairment. The second amendment added, as an exclusion criterion, patients on medication which could cause hypotension. In France,

there was one amendment: this required that in the case of a severe adverse event a blood sample should be taken which allowed the evaluation of the plasma level of the antidepressive drugs. However, the amendment was not implemented. In the UK, there were two amendments: the first amendment better specified the ethical aspects of the protocol (Section 15.0 of Appendix 12.1.1); the second amendment required the plasma level of imipramine to be measured at steady state (Day 56 or end of study) in order to correlate tolerability and efficacy to imipramine level. However, as samples were taken only occasionally, the correlation level/efficacy was not done.

3.2 Ethics

3.2.1 ETHICS COMMITTEE

Approval from the Ethics Committees or Institutional Review Boards (IRBs) of the participating centres, in accordance with the regulations and requirements of individual countries, had to be obtained before the study could be undertaken. It was the responsibility of each of the investigators to submit the study protocol with its attachments to the Ethics Committee/IRB. Central approval was required and obtained in Ireland and local approvals were required and obtained in all the countries participating to the study. For Australian centres number 1 and 3 (Melbourne and Sydney, respectively) the approval was obtained on a draft version of the protocol, different from the final one focusing on the definition of adverse events as moderate to severe instead of mild to severe in the Section Statistical Consideration (Section 14.0 of Appendix 12.1.1).

The notifications of approval are kept in the trial master file.

The written approval of the Ethics Committee or IRB had to include the names and professions of all its members. In accordance with local requirements, the investigators were responsible for informing the Ethics Committees of any emergent problems, serious adverse events or protocol amendments.

3.2.2 PATIENT INFORMATION

Before entering the study, an explanation of the nature, duration, purpose of the study and action of the compound had to be given to each patient in such a manner that he/she was made aware of the potential risks, inconveniences or adverse events that could occur, and could express his/her informed consent to participation. The proposed consent form is enclosed (Enclosure 5 of Appendix 12.1.1). The translations in the national languages and the individual centres forms containing the possible changes requested by the Ethics Committees, if any, are kept in the study master file. The forms were signed by the patient or the next of kin, and/or the investigator. In the latter case, the signature of a witness was required to testify that full information was given to the patient.

All unpublished documentation including the protocol, the CRF and the Investigator's Brochure was confidential. These documents could not be disclosed to a third party without the written consent of the Sponsor. The submission of these documents to the Ethics Committee was expressly permitted. The investigators agreed that the Sponsor maintained the right to utilise the results of this study, in their original form and/or in a global report, for submission to the governmental and regulatory authorities of any country.

3.3 Study Population

Elderly depressed patients in acceptable physical condition who were under in-patient care or attending out-patient clinics of the participating centres were selected in accordance with the following inclusion and exclusion criteria.

3.3.1 INCLUSION CRITERIA

The criteria for participation in this study were as follows:

- Patients of either sex, of any race, aged over 65 years
- Fulfilment of the DMS-III-R [10] criteria for Major Depressive Episode/Disorder or Dysthymia
- The initial (pre-treatment) total score for the 21-item HAMD [11] had to be ≥ 18
- The initial (pre-treatment) total score for the MMS (Enclosure 4 of Appendix 12.1.1) had to be ≥ 22
- Informed consent was obtained from the patient or next of kin, and/or the investigator (see Section 3.2.2)

3.3.2 EXCLUSION CRITERIA

Exclusion criteria for patients recruited to this study were as follows:

- Resistance to antidepressant treatment (defined as lack of response to at least two previous courses of antidepressant therapy given at full doses for more than 1 month)
- Clinically relevant abnormal findings in the physical examination and/or laboratory tests at admission
- History of major depressive disorder associated with endocrine disorders: hypo- or hyperthyroidism (defined as values at least 10% outside normal parameters for TSH and T₄), adrenal insufficiency, etc.
- Past history of drug hypersensitivity

Pharmacia

Document 9550089

- History or presence of gastrointestinal disease likely to cause impairment of gastrointestinal absorption, liver disease (hepatic insufficiency defined as clinically relevant abnormal findings of the following tests: hemolytic markers - SGOT and SGPT; cholestasis markers - total bilirubin, gamma-GT, alkaline phosphatase; mesenchymal activation markers - serum protein electrophoresis), kidney disease (renal insufficiency defined as moderate to medium renal impairment with creatinine clearance not lower than 30 ml/min) or other conditions known to interfere with absorption, distribution, metabolism and excretion of drugs.
- Participation in a clinical study with an investigational compound in the 4 weeks preceding the study
- Evidence of Substance Use Disorder (DSM-III-R), currently or within the past 6 months
- Chronic respiratory insufficiency (excluded by physical examination and pulmonary function test or X-ray)
- History of seizures or brain injury; current evidence of clinically important haematopoietic or cardiovascular diseases; current evidence of urinary retention or glaucoma
- Electroconvulsive therapy (ECT) in the previous 6 months
- High risk of suicide

3.3.3 WITHDRAWAL CRITERIA

Patients could be withdrawn from the study at any time for the following reasons:

- Voluntary withdrawal by the patient
- Unacceptable toxicity, defined as the occurrence of serious adverse events (see Section 3.6.2.1)
- Lack of efficacy, defined as worsening of the global clinical picture (CGI - see Section 3.6.1.2) after at least 3 weeks of treatment
- Shift to mania

In the case of treatment discontinuation, the final set of tests was carried out wherever possible.

3.3.4 SAMPLE SIZE - NUMBER OF PATIENTS PLANNED

Each of the planned 31 centres participating in the study were to recruit, within a period of 1 year, a sample of 6 to 12 patients, so that a total of 300 patients were to be recruited overall.

Few of the centres which initially agreed to participate in the study never did so for logistical reasons and were replaced with other centres. During the study, 9 centres in the UK, 5 in Belgium and 2 in Australia were recruited in order to reach the foreseen patient sample.

As shown in the Clinical Investigators and Affiliation List (Appendix 12.1.4), 46 centres in 7 countries (Australia, Belgium, Brazil, France, Germany, Ireland and the UK) participated in the study. In 23 centres the number of patients admitted was lower than 6, while recruitment was extended in 1 centre (number 36). Recruitment was stopped after randomisation of 347 patients, slightly above the calculated sample size for an 'intent to treat' analysis.

Patients who dropped out of the study for any reason were not substituted. For those patients selected for the study who dropped out at any time documentation was provided.

3.4 Treatments

3.4.1 TREATMENTS TO BE COMPARED

After an initial wash-out period of 4-28 days (21-28 days in the case of previous fluoxetine therapy) patients received one of 2 possible treatments for 8 weeks: oral reboxetine 2 mg b.i.d. or oral imipramine 25 mg in the morning and 50 mg in the evening (imipramine was given at a dose of 25 mg b.i.d. for the first three days of the study). In the case of inefficacy or unsatisfactory response, combined with good tolerability, after 3 weeks of treatment, the dose of reboxetine was allowed to increase up to 6 mg daily (4 mg in the morning and 2 mg in the evening) and the dose of imipramine up to 50 mg b.i.d. for the remaining 5 weeks of the study.

3.4.2 IDENTITY OF TEST TREATMENTS

Indistinguishable capsules containing either reboxetine 2 mg or 4 mg (two x 2 mg tablets) (Batch No: SF1308, A06G01 [2 mg]; SF1264, A06G02 [4 mg]) or imipramine 25 mg or 50 mg (two x 25 mg tablets) (Batch No: SF1321, A27G01 [25 mg]; SF1265, SF1323, SF1353, A27G02 [50 mg]) were supplied by the Sponsor. Copies of certificates of analysis for the test treatments are presented in Appendix 12.1.5.

3.4.3 DOSE SELECTION AND TIMING

All patients recruited for the study received either one capsule of reboxetine 2 mg b.i.d. (morning and evening), or one capsule of imipramine 25 mg (morning) plus one capsule of imipramine 50 mg (evening) for 8 weeks. For the first three days of the study, imipramine was given as one 25 mg capsule in the morning and one 25 mg capsule in the evening. For patients who showed an ineffective or unsatisfactory response (worsening, no change or minimal improvement in the CGI; see Section 3.6.1.2) with good tolerability, the dose of reboxetine was allowed to increase, after 3 weeks of treatment, to 6 mg daily (4 mg in the morning and 2 mg in the evening) and the dose of imipramine to 50 mg b.i.d., for the remaining 5 weeks of the study. In those patients who then displayed poor tolerance at this increased dose, the dose was reduced to the previously well tolerated level.

The treatment was to be administered at least 2 hours before or after meals.

Daily doses of the experimental treatments were selected taking into consideration the reported greater response, particularly in terms of intolerance, to antidepressant drugs in the elderly, possibly connected with pharmacodynamic, as well as pharmacokinetic, changes in this population [8]. In addition, the daily dose of reboxetine was chosen on the basis of results of the previously mentioned scaling-up, repeated doses study in 12 elderly patients [7] which showed that the maximum tolerated dose of reboxetine was 6 mg/day in 8 out of the 12 subjects. The daily dose of imipramine was selected on the basis of published evidence from controlled studies [8, 9] and of manufacturer recommendations [12].

3.4.4 METHOD OF ASSIGNING PATIENTS TO TREATMENT GROUPS

A randomisation list balanced within centre and stratum (i.e. Dysthymia and Major Depressive Episode/Disorder) and every 4 assignment per stratum was originally generated for patient allocation either to reboxetine or imipramine. The test treatments were labelled according to the randomisation sequence number within centre and stratum. Each randomised patient was then identified by the corresponding centre, stratum (MD for Major Depressive Episode/Disorder and DT for Dysthymia) and treatment number.

Patient allocation to treatment was done by the investigator at the end of the wash-out period on the basis of the patient's time of entry into the study.

3.4.5 TREATMENT SUPPLY AND BLINDING

To ensure the double-blind nature of the study, indistinguishable test treatment in identical cartons was to be identified using double labels indicating the protocol number, patient number, treatment period, batch number and expiry date (Enclosure 6 of

Appendix 12.1.1). The detachable half of the label was to be included in the appropriate place in the CRF when used.

Eighteen glass amber bottles showing the patient number and the appropriate day or week of treatment (Days 1-3, Days 4-7, from Week 2 to Week 8) were prepared for each patient. For the first week two 'morning' and two 'evening' bottles were provided: two bottles contained medication for Days 1-3 (morning and evening) and the other bottles contained medication for Days 4-7 (morning and evening). Each 'morning' and 'evening' bottle for the treatment from Week 2 to Week 8 contained the medication necessary for 7 days' treatment i.e. 8 capsules (7 capsules plus 1 for possible losses). Additional 5 cartons showing the patient number, the appropriate week of treatment (Week 4-8) and the level of dosage (dose 2) were prepared for each patient in case of possible dosage increases during the last 5 weeks of the study.

3.5 Treatment Procedures

The investigators were given individual sealed envelopes containing the information on patient's treatment, and these were to be opened only in case of emergency necessitating treatment identification. In the event of an emergency, the investigators were to notify the study monitor immediately (within 24 hours), and were to report a full description of the reasons for opening the code on the Adverse Event Form in the CRF. The sealed individual codes were to be returned to the Sponsor at the end of the study.

3.5.1 CONCOMITANT THERAPY

Concomitant medications considered essential were allowed at admission to the study. In the case of events arising during the course of the study, non-psychotropic medications which were considered necessary for the patient's welfare could be administered and were not considered protocol violations. A short-acting benzodiazepine, chloral hydrate or chlormethiazole was permitted at bed-time as a sleep inducer on an 'as required' basis. The medication, dosage and frequency of administration were recorded on the CRF.

3.5.2 TREATMENT ACCOUNTABILITY AND COMPLIANCE

All drug supplies were handled under the direct responsibility of the investigators and held by the Hospital Pharmacy. The study monitors checked drug storage conditions during site visits.

The investigators were responsible for drug accountability and kept a record of the test compounds received from the Sponsor as well as the drugs dispensed to each patient on the occasion of each visit. The upper label from each of the weekly bottles dispensed to each patient was detached and fixed in the appropriate space in the CRF. On the same occasion, bottles of the previous supply were returned by the patient. These used bottles were returned to the study monitors during site visits. All unused medication was to be returned to the Sponsor at the end of the study.

3.6 Efficacy and Safety Variables

At screening, a full medical history and physical examination (including chest X-ray or pulmonary function test and ECG) were carried out and vital signs and laboratory values were measured. Patients were classified according to the DSM-III-R classification and the MMS. The severity of depression was evaluated using the HAMD scale and CGI.

3.6.1 EFFICACY

Every randomised patient was evaluable for efficacy analysis.

Patients were seen at regular intervals throughout the study and the following efficacy assessments carried out at the specified intervals. All psychiatric evaluations and ratings were to be carried out by the same observer for a given patient, and in the same setting and at the same time of day if possible.

3.6.1.1 Hamilton Depression Rating Scale

The severity of depression was evaluated using the HAMD scale at screening, and on Days 0, 7, 14, 21, 28, 35, 42, 49 and 56.

The HAMD scale [11] contained 21 items, each of which was scored (0-2, 0-3 or 0-4) to reflect whether the symptom was absent, mild, moderate or severe. Some of the items were more heavily weighted than others. The scores for all the symptoms were added together to give a global judgement of the severity of the depression.

A decrease of at least 50% in the total HAMD score compared with Day 0 was considered to be a response, whereas a total HAMD score of 10 or less was considered a remission.

Pharmacia

Document 9550089

The 21-item list of the HAMD used in this study is as follows:

	<u>Item</u>	<u>Score range</u>	<u>Factor</u>
1.	Depressed mood	(0-4)	V
2.	Feelings of guilt	(0-4)	III
3.	Suicide	(0-4)	III
4.	Insomnia early	(0-2)	VI
5.	Insomnia middle	(0-2)	VI
6.	Insomnia late	(0-2)	VI
7.	Work and activities	(0-4)	V
8.	Retardation	(0-4)	V
9.	Agitation	(0-4)	III
10.	Anxiety (psychic)	(0-4)	I
11.	Anxiety (somatic)	(0-4)	I
12.	Somatic symptoms gastrointestinal	(0-2)	I
13.	Somatic symptoms general	(0-2)	I
14.	Genital symptoms	(0-2)	V
15.	Hypochondriasis	(0-4)	I
16.	Loss of weight	(0-2)	II
17.	Insight	(0-2)	I
18.	Diurnal variation	(0-2)	IV
19.	Depersonalisation and derealisation	(0-4)	III
20.	Paranoid symptoms	(0-3)	III
21.	Obsessional symptoms	(0-2)	III

More detailed definitions of the items included in the scale can be found in Enclosure 3 of Appendix 12.1.1.

Factorialisation was carried out according to the ECDEU manual [13], to yield 6 factors: Anxiety/Somatisation (I), Weight (II), Cognitive Disturbances (III), Diurnal Variation (IV), Retardation (V), Sleep Disturbances (VI).

Pharmacia

Document 9550089

3.6.1.2 Clinical Global Impression

Severity of illness was assessed by the investigator using the CGI [13] on Days 0, 7, 14, 21, 28, 35, 42, 49 and 56. The following scale was used

1. = normal, not at all ill
2. = borderline mentally ill
3. = mildly ill
4. = moderately ill
5. = markedly ill
6. = severely ill
7. = amongst the most extremely ill patients

The investigator also evaluated the effect of treatment at each visit (Global Improvement), with reference to the patients' condition at the start of the study, according to the following scale:

1. = very much improved
2. = much improved
3. = minimally improved
4. = no change
5. = minimally worse
6. = much worse
7. = very much worse

An Efficacy Index was then assessed by the investigator, as described in [13], as the ratio between the evaluation of improvement, scored from 1 (unchanged or worsened) to 4 (marked improvement), and the evaluation of tolerability from 1 (no side effects) to 4 (side effects outweigh therapeutic effect). The Efficacy Index score ranges from 0.25 (no global benefit) to 4 (maximal global benefit).

3.6.1.3 Montgomery and Asberg Depression Rating Scale

The MADRS [14] was measured on Days 0, 7, 14, 21, 28, 35, 42, 49 and 56.

Pharmacia

Document 9550089

This scale consists of ten items relating to depression selected from the 67 items in the Comprehensive Psychiatric Rating Scale [15]. The items contained in the MADRS were selected on the grounds that they were sensitive to change. The ten items were as follows:

1. Apparent sadness
2. Reported sadness
3. Inner tension
4. Reduced sleep
5. Reduced appetite
6. Concentration difficulties
7. Lassitude
8. Inability to feel
9. Pessimistic thoughts
10. Suicidal thoughts

The scale requires a structured interview for completion. A score of 0 to 6 for each item was used as in reference 15.

More detailed definitions of the items included in the scale can be found in Enclosure 15 of Appendix 12.1.1.

3.6.1.4 Geriatric Depression Rating Scale

The severity of depression was evaluated using the GDS on Days 0, 7, 14, 21, 28, 35, 42, 49 and 56. The GDS scale [16] contained 30 questions each of which required a 'yes' or 'no' answer. The scores for all the questions were added together to give a global judgement of the severity of the depression.

The questions included in the scale can be found in Enclosure 16 of Appendix 12.1.1.

3.6.2 SAFETY

Every patient who received one dose of test treatment was included in the safety evaluation.

Pharmacia

Document 9550089

3.6.2.1 Adverse Events

Spontaneously Reported

Patients were notified of any possible adverse events they might experience and were instructed to report any such adverse event to the investigators immediately.

The occurrence of adverse events was recorded on Days 0, 7, 14, 21, 28, 35, 42, 49 and 56.

Any newly observed sign or symptom (including clinically relevant laboratory abnormalities), noticed by the investigators or reported by the patients were reported, regardless of presumed relationship to the study medication, in the appropriate section of the CRF (Adverse Event Report Form - Enclosure 10 of Appendix 12.1.1).

For each adverse event, the following information was entered in the CRF: description, date of onset, date of stopping, severity, drug cause-effect relationship, outcome, effect of withdrawal of treatment and re-challenge. The investigators also had to note if the double-blind code had been broken, the action taken regarding the test drug (none, dose reduced or discontinued) and any treatment given as a result of the adverse event.

Severity was coded as follows:

1. = mild - awareness of sign or symptom, but easily tolerated
2. = moderate - discomfort enough to cause interference with usual activity
3. = severe - incapacitating with inability to work or do usual activity
4. = unknown

Relationship to test drug was coded as definite, probable, possible, doubtful, unknown or not related; as a guideline to coding the Karch and Lasagna modified criteria were used as shown in Enclosure 11 of Appendix 12.1.1.

Pharmacia

Document 9550089

All serious* and/or unexpected** adverse events had to be reported to study monitors immediately (within 24 hours), and the details recorded on an Adverse Event Report Form. **Serious adverse event** was defined as any experience that was (potentially) fatal or life-threatening, disabling, incapacitating, requiring inpatient hospitalisation, causing a congenital anomaly or cancer, or due to an overdose. **Unexpected adverse event** was defined as any adverse experience that was not identified in nature, severity or frequency in the current Investigator's Brochure for the study.

The same procedure applied for all patients who died during the course of the study or within 30 days of completion, irrespective of whether the event was judged as related to treatment. If an autopsy was performed, a copy of the pathological report was to be sent to the Sponsor.

Adverse events reported through a check-list

The presence or absence of selected adverse events was solicited through a check-list especially designed for the identification of events frequently reported in patients on antidepressant medication. The check-list is shown in Enclosure 9 of Appendix 12.1.1. These events could be either reported by the patient or observed by the investigator.

For each adverse event, the same procedure as for spontaneously reported adverse events was followed in terms of recording of information in the CRF (Adverse Event Report Form) and reporting of the 'serious' or 'unexpected' adverse event to the Sponsor.

3.6.2.2 Clinical and Laboratory Tests

Vital signs

Body weight and temperature as well as blood pressure and heart rate (supine and standing) were measured at screening and on Days 0, 7, 14, 21, 28, 35, 42, 49 and 56.

Supine blood pressure and heart rate were measured in the morning after 5 minutes in the supine position and standing blood pressure and heart rate were measured 1-2 minutes after standing up.

Chest X-ray or pulmonary function tests

An X-ray, or a pulmonary function test, was performed at screening.

* Code of Federal Regulation, Vol 21, Part 312. Revised as of April 1 1987, page 75.

** Bem JL, Breckenridge AM, Mann RD, Rawlins MD. Review of yellow cards (1986): report to the Committee on the Safety of Medicines. BR J Clin Pharmacol 1988; 26: 679-689.

Pharmacia

Document 9550089

ECG

An ECG was recorded at screening and on Days 28 and 56.

ECG was also recorded for patients who withdrew prematurely because of a serious adverse event.

Laboratory tests

Laboratory tests were recorded at screening and on Days 28 and 56.

The laboratory tests comprised the following: full blood count, serum electrolytes, liver enzymes, urinalysis, blood sugar, serum alkaline phosphatase, blood urea nitrogen (BUN), serum creatinine, uric acid, total bilirubin, total serum protein and electrophoresis, serum cholesterol and triglycerides, and at screening only, TSH and T₄. In addition, at screening only, the creatinine clearance was directly examined or calculated by using the formula reported in the protocol (Section 11.1 of Appendix 12.1.1).

Laboratory tests were also measured for patients who withdrew prematurely because of a serious adverse event.

Pharmacia

Document 9550089

3.7 Study Procedures and Flow Chart

3.7.1 SCHEDULE OF ASSESSMENTS

Assessment	Pre-Treatment Screening	Treatment Day									
		0	7	14	21	28	35	42	49	56

GDS		x	x	x	x	x	x	x	x	x	x
MADRS		x	x	x	x	x	x	x	x	x	x
Compliance check			x	x	x	x	x	x	x	x	x
Dispensing medication		x	x	x	x	x	x	x	x		
Adverse events		x	x	x	x	x	x	x	x	x	x

3.7.2 PROCEDURES AT EACH VISIT

At screening, a full medical history and physical examination (including chest X-ray or pulmonary function test and ECG) were carried out and vital signs and laboratory values were measured. Patients were classified according to DSM-III-R; their cognitive function was rated by the MMS and the severity of depression was evaluated using the HAMD scale.

One month after treatment discontinuation, a follow-up visit was carried out for each patient in order to monitor possible withdrawal reactions and to collect information on

any adverse events that had occurred during this period. For ethical reasons, patients willing to continue receiving study drug after completion of the 8-week treatment period were maintained on the same medication in blind conditions until the study was completed in the last patient and the CRFs were collected. Efficacy was assessed by HAMD and CGI at monthly visits. Adverse events and vital signs were also recorded at monthly intervals and ECG and laboratory values at 3-monthly intervals. The medications were prepared as described in Section 3.4.5, but in monthly, instead of weekly units.

3.8 GCP Compliance, Data Quality Assurance

The study started after the formal adoption of GCPs by European Regulatory Authorities. Company SOPs were released and implemented during the conduct of the study and maximal efforts were done in order to make the study as much compliant as possible with them. Operating procedures for study monitoring and co-ordination were defined and are described in Attachment A of Appendix 12.1.1. Inter-rater reliability sessions with training purpose on the instrument used for the assessment of change, and particularly on the HAMD, were carried out during the investigators meetings organised by country and/or the monitoring visits by employing 4 videotaped interviews.

During the study, monitoring visits were made at regular intervals at which the monitor validated the content of the CRF against source documents on the basis of the agreed procedures.

Site, trial master file and report audits were carried out by the Company Quality Assurance Unit.

3.9 Statistical Analysis

3.9.1 SAMPLE SIZE CONSIDERATIONS

In elderly patients suffering from Depressive Disorders reboxetine was expected to show comparable efficacy to imipramine, with a more favourable tolerability profile. The current study aimed at showing such a better tolerability profile, measured as the ratio between the number of patients experiencing at least one treatment emergent adverse event out of the total number of randomised patients, whichever the nature and the degree of severity.

Accordingly, the system of hypotheses set was the following:

$$H_0 : \delta = 0$$

$$H_1 : \delta \neq 0$$

where δ is the true between treatment difference in adverse event rate.

Difference $\geq 20\%$ between the treatments was considered clinically relevant. In the absence of a precise estimate about the rate defined as above, sample size was maximised considering a adverse event rate of 40% and 60%, respectively, for the two groups. Under this

assumption, 260 patients were required to detect a difference of 20% or higher at the 0.05 two-tails-alpha level of statistical significance and with a power ≥ 0.90 . The size of the trial was enlarged according to Fleming O'Brien method [17], in order to adjust for one interim analysis after the first 67 patients in each arm were recruited. Overall the study was to recruit approximately 270 patients; this figure was rounded up to 300 in order to provide power coverage in case the variability might have increased due to the drop out rate.

Recruitment was stopped after randomisation of 347 patients, a sample not surprisingly 15.7% higher than foreseen, in view of the large number of participating centres (46) to be coordinated in the recruitment termination procedure.

3.9.2 STATISTICAL AND ANALYTICAL PLANS

3.9.2.1 Baseline Comparability of Treatment Groups

Baseline characteristics (e.g. age, diagnosis, age at onset, number of previous episodes) which might have influenced the main end-point of the study were summarised for all those patients who entered into the study and who were subsequently randomised either to reboxetine or to imipramine. Descriptive statistics by treatment were presented both for the total patient sample, and for each subgroup identified by the stratification factor, i.e. patients with Major Depressive Episode/Disorder and Dysthymia.

3.9.2.2 Efficacy Analyses

Definitions

The following definitions apply to the set of data analysed:

HAMD decrease	the difference between the end of treatment and baseline measurements of 21-item HAMD total score. Either the last per-protocol assessment, when the patient regularly completes the study, or the last assessment before dropping out of it was taken as the end of treatment.
Remission	21-item HAMD total score lower than or equal to 10 (absolute value).
Response	<u>according to 21-item HAMD scoring system:</u> 21-item HAMD total score decrease equal to or greater than 50% of the pre-treatment value (Baseline: visit 0). According to this definition, and based on the inclusion criterion which required a 21-item HAMD total score at entry at least equal to or greater than 18, not all the patients who achieved a remission (as defined above) were included into the broader category of response ($18 \cdot 0.5 = 9$).

According to CGI - Global Improvement classification system:
CGI - Global Improvement score of 1 or 2, very much and much improved, respectively, at last assessment.

Methods

Efficacy variables, including total score of HAMD and MADRS, as well as CGI, were summarised by descriptive statistics (mean, median, standard deviation [SD], minimum, maximum, or distribution of frequency of scores) as calculated both at each visit and using the last valid observation, for both groups. In particular, in order to describe the time pattern of last valid observation values, one table reports descriptive statistics visit by visit only for those patients who dropped out of the study at that particular visit. The frequency of the patients who were improved, unchanged or deteriorated for the CGI - Severity of Illness at last assessment compared to baseline was also presented.

All the above mentioned tabulations as well as the inferential statistics described below, were presented for the total sample, and for each subgroup identified by the stratification factor, i.e. patients with Major Depressive Episode/Disorder and Dysthymia.

Two-tails 95% confidence intervals of the between treatment differences of HAMD decrease [18], and of the rates of 'much improved' and 'very much improved' according to CGI score [19], were the basis of the efficacy conclusions. Complementary to the quantitative analysis of 21-item HAMD total score, the qualitative analysis classifying the patients according to the above definitions (Responses/Remissions) at the last valid assessment was carried out. Ninety-five per cent confidence intervals (two-tailed) of the proportions in each treatment were computed.

3.9.2.3 Safety

End-point analysis

The adjusted odds ratio and its confidence interval was calculated using the Mantel-Haenszel method [20]. Although not protocolled, the illness diagnosis rather than the centre was taken as the stratification factor, not only because there were more centres than expected, with often too few patients in many of them, but also because diagnosis unexpectedly seemed to unevenly influence the adverse event rate in the treatment groups. Homogeneity across strata was tested by Breslow-Day test [20]. Additionally, the same analysis was applied to events or cluster of events of particular relevance in terms of frequency of occurrence. Time to event analysis was included as part of the regular analysis of safety as described below.

Other safety analyses

Vital signs as measured at each assessment time were summarised by descriptive statistics. Decreases in standing systolic blood pressure considered clinically relevant

(decrease ≥ 20 mmHg) were listed and the frequency of patients showing these decreases in each treatment group computed. Patients with orthostatic hypotension (a decrease ≥ 30 mmHg of systolic blood pressure from lying to standing) were described. Moreover, the frequency of patients showing clinically relevant (20% or more vs baseline) or such a modification accompanied by absolute critical values (≥ 160 or ≤ 100 mmHg for systolic blood pressure; ≥ 100 or ≤ 70 mmHg for diastolic blood pressure; ≥ 100 or ≤ 50 beats/min for heart rate) at each evaluation time were tabulated.

ECG have been summarised in frequency tables showing normal/abnormal findings at each visit. Changes from baseline (i.e. normal to abnormal and vice versa, or changes in type of abnormality) have been displayed.

For all the laboratory examinations and within each of the two treatments, the following analyses have been provided:

- frequency and percentage of patients whose values were below, equal or above the normal range at each visit. Either MacNemar test or Stuart Maxwell test [21] has been applied in order to test if the distribution across categories at baseline differs from the distribution at each visit.
- continuous values of laboratory tests were standardised according to a method proposed by Chuang-Stein [22], using as reference values mainly the ones reported in Cecil's Textbook of Medicine (Appendix 12.1.8) [23]; the Wilcoxon Rank Signed test for paired data was applied in order to compare the values during treatment with those recorded at baseline.

The use of statistical tests in this framework aimed mainly at providing screening tools for selecting those changes, within each single examination, to this purpose the tests were considered as statistically significant if $p < 0.01$. In addition, abnormal values of laboratory tests defined as clinically relevant were specially considered and listed. Criteria used to judge values as clinically relevant are reported in Appendix 12.1.8.

All the safety analyses mentioned above only included patients who had both the baseline assessment and at least one post-baseline assessment during the treatment period.

In the analysis of the adverse events, the attention has been concentrated on treatment emergent signs and symptoms (i.e. events which were not present at baseline and appeared during treatment or, if present at baseline, became more severe during treatment). These analyses are essentially descriptive and, for each treatment group, were performed in terms of both patients complaining of adverse events, and the events themselves.

The analyses were performed taking into account (i) the occurrence of at least one sign or symptom, (ii) the occurrence of at least one event for each body system or for selected

aggregation of symptoms (cluster) likely to share the same underlying mechanism or described with synonyms and (iii) in detail, the occurrence of each type of sign or symptom. When severity of the events was considered, the worst reported degree was selected. In order to explore possible differences, patients were also classified by sex and age.

The cumulative risk of developing an individual adverse event and adverse event clusters (newly emerged in 5% or more of patients in at least one treatment group) was estimated by Kaplan-Meier method and the between treatment comparisons were carried out by the log-rank test [24]. Furthermore, the weekly frequency of patients experiencing adverse events (either because of the onset of new events or because of the persistence of those previously developed) was assessed.

The events have been described by frequency tables according to duration, onset time, symptomatic treatment, relationship to study medication, study drug adjustment, dechallenge/rechallenge after action on study drug and outcome. The duration of any event was computed as the number of days from its onset up to its recovery or, in the absence of recovery date, up to the last reporting date (approximate duration).

3.9.2.4 Changes in the Conduct of the Study or Planned Analysis

No deviation in the analysis of the main end-point was introduced, but the fact that diagnosis rather than centre was taken as stratification factor. Diagnosis was included even though not mentioned into the protocol in order to make the analysis consistent with the stratified design selected. On the contrary, centres were not taken as strata due to their large number, higher than anticipated. Should they had been considered, the number of empty cells would have invalidated the analysis. Finally, notwithstanding the recognised failure by the present trial of rejecting the null hypothesis of equal tolerability, the results were presented as Odds Ratios (OR) and corresponding confidence intervals in order to provide anyhow some insight in the size of relative impact of reboxetine on clinical safety profile.

In general, analyses carried out were consistent with the ones anticipated in the protocol with the following exceptions:

- a) additional to the criterion for evaluating efficacy specified into the protocol (i.e. the proportion of patients scored as very much improved or much improved), the one based on HAMD score was introduced in order to provide descriptive and inferential statistical analyses comparable with the ones provided for the adult population. Concordance between the two classification criteria in the studied population is discussed in the section of results.

- b) since the main end-point of the study focused on safety, no method for analysing efficacy was specified into the protocol. In fact, efficacy analysis was carried out introducing confidence interval of estimates of HAMD decrease and response rate at last assessment in a similar fashion to the analyses carried out for the studies in a non-elderly population.
- c) safety was presented in a more articulated fashion than that anticipated into the protocol.

The deviations were introduced to give a better picture of the product profile and no extra claim is being done on the results obtained.

3.10 Data Management

Data management was carried out in the Biometrics and Data Management Department of Pharmacia, Milan. CRFs data were entered into a IBM 3090 computer (according to the arrival flow) through data entry masks generated by SAS FSP release 6.06 and 6.07. Subsequently, data were scrubbed by an electronic procedure set up for this purpose which generated listings of discrepancies between the actual value entered and predefined algorithms. Computer programs generated to this purpose are archived in Biometrics and Data Management Department. These listings were reviewed by clinical personnel and editing of CRFs was requested at the investigator site, whenever appropriate. Corrections were entered iterating the loop until the files were completely cleaned.

Creatinine Clearance was either directly measured at the centres or calculated according to the following formula:

$$[(140 - \text{age}) * \text{weight (kg)}] / [\alpha * \text{serum creatinine (mg/dl)}]$$

where α is a sex-related coefficient corresponding to 72 for males and 85 for females.

ECG tracings were classified and subsequently grouped according to the codes reported in Appendix 12.1.12. Previous and concomitant diseases were coded according to ICD9 dictionary [25]; concomitant drugs according to the Drug Reference List [26] and subsequently grouped according to the ATC System Classification [27]; adverse events according to the WHO-ART dictionary [28]. The WHO-ART dictionary does not include the terms 'urinary hesitancy' and 'blurred vision' which were, consequently, coded as 'micturition disorder' and 'vision abnormal', respectively. While in the tables the two events are reported according to the WHO-ART codes, in the text they are presented as 'urinary hesitancy' and 'blurred vision'.

Reporting, as well as statistical analyses, were carried out with SAS PROCs (version 6.07), apart from Stuart-Maxwell test and confidence interval calculation. The programs relevant to the latter ones are appended in Appendix 12.1.10. A selection of statistical analyses outputs is shown in Appendix 12.1.11.

4. STUDY PATIENTS

4.1 Disposition of Patients

The copy of the randomisation list is given in Appendix 12.1.7.

Three hundred and forty-seven patients were admitted to the study from September 1992 to May 1994 and randomised to treatment (176 received reboxetine and 171 imipramine) by investigators at 46 centres, as shown in Table 1. Of the 347 patients, 218 were randomised to the MDD stratum (109 patients in reboxetine and 109 in imipramine group) and 129 to the DYS stratum (67 patients in reboxetine and 62 in imipramine group).

As shown in Table 2, a total of 253 patients (72.9%) completed the study and 94 (27.1%) withdrew, 49 (27.8%) in the reboxetine group and 45 (26.3%) in the imipramine group. Among the reboxetine patients withdrawn, one patient dropped out of the study having performed the efficacy assessments at Day 56. In the MDD subpopulation the proportion of patients withdrawing was slightly higher on imipramine than on reboxetine (35.8% vs 30.3%, respectively), while in the DYS subpopulation this proportion was in favour of imipramine (9.7% vs 23.9% on reboxetine). Frequency and timing of withdrawal are shown as primary reason for withdrawal in Table 3.

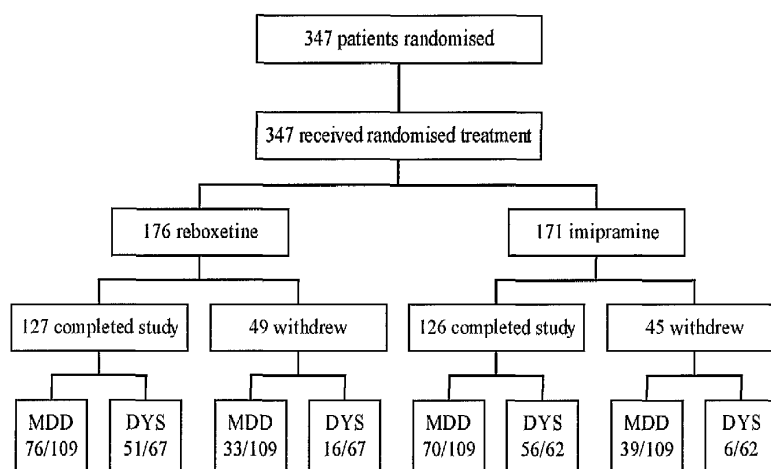

Adverse events or intercurrent illnesses were the main reason for withdrawal in 23 patients of the reboxetine group and in 28 patients of the imipramine group. In addition, one patient on imipramine committed suicide. In 3 cases on reboxetine, and 2 cases on imipramine, the events (agitation/insomnia and insomnia on reboxetine; lassitude on imipramine) and the intercurrent illnesses (suspected multiple myeloma [subsequently not confirmed] on reboxetine, and hysterectomy for endometrium carcinoma on imipramine) causing discontinuation had emerged before starting the experimental treatment. Therefore, the discontinuation rate for newly emerged adverse events was 11.4% on reboxetine and 15.8% (including the death) on imipramine. Adverse events associated with discontinuation in individual cases are discussed in the Adverse Event Section (see Section 8.2.3.2). Deterioration was the main reason for withdrawal in 10 patients per treatment group. Remaining cases mainly included uncooperative patients (12 and 3 cases on reboxetine and imipramine, respectively).

In Table 3 the frequency and timing of withdrawal as primary reason are also shown by diagnosis. In the MDD subpopulation, adverse events or intercurrent illnesses were the main reason of withdrawal in 14 cases (15 minus the 1 case in which event/concomitant illness emerged before the study start) on reboxetine (12.8%) and 21 (23 minus the 2 cases in which event/concomitant illness emerged before the study start) on imipramine (19.3%). In the DYS subpopulation, the proportion of patients having adverse events or intercurrent illnesses as the main reason of withdrawal was very similar in the two groups: 9.0% on reboxetine (8 minus the 2 cases in which event/concomitant illness emerged before the study start) and 9.7% on imipramine (6 cases, including the occurred

death). Uncooperative cases were more frequent on reboxetine in both the diagnostic subgroups.

The disposition of patients is shown in the following chart and in Table 2.

Disposition of patients

4.2 Protocol Deviations

Compliance with entry criteria

The frequency of non-compliance with inclusion/exclusion criteria of relevance for inferential purpose is given in Tables 4 and 5. The most frequent reason for possible non-compliance with one of the exclusion criteria was related to abnormalities of thyroid function tests, possibly suggestive of an underlying, undiagnosed endocrine disorder: 7.2% in the reboxetine group (12 out of 166 assessed) and 5.0% in the imipramine group (8 out of 159 assessed). Concomitant medications not allowed according to the protocol during the wash-out period were administered to 18.8% of the reboxetine group patients and 19.3% of the imipramine group patients. On the whole, non-compliance with these entry criteria was infrequent and similarly represented in both treatment groups, with the exception of those patients aged under 65 years (4 in the reboxetine group and none in the imipramine group). Information on creatinine clearance, either calculated or tested,

is available for 172 of the 176 patients treated with reboxetine and for 169 of the 171 patients treated with imipramine. Table 5 shows the frequency of patients with values of creatinine clearance < 30 ml/min, possibly suggestive of moderate to medium renal insufficiency: the proportion of patients with this critical value was similar in the two treatment groups (4.6% and 6.8%, in the reboxetine and imipramine group, respectively, in the sample of patients having the creatinine clearance calculated, and 0% in both treatment groups in the sample of patients having the creatinine clearance tested).

No major differences were seen in frequency of non-compliance with inclusion/exclusion criteria in the MDD and DYS subpopulations, with the exception of the concomitant medications not allowed during the wash-out period, which were administered to a higher proportion of patients in the reboxetine than in the imipramine group in the DYS subpopulation (17.9% vs 14.5%, respectively) (Table 4).

Randomisation

Distribution and use of study medication were to be done, as previously mentioned, according to centre and stratum. However, owing to minimise the waste of drug, it was shipped to centres in full blocks of 4 treatments for each stratum. In order to provide a discrepancy log with respect to randomisation sequence, patients were listed according to their study entry date within centre and stratum and the treatment foreseen to be assigned according to the random sequence was matched by a sequential criterion. Mismatching between the foreseen treatment and the treatment actually received was identified as a randomisation error.

As reported in Table 6, errors in randomisation procedures led to administration of non-randomised treatment to a number of patients, at a similar frequency in both treatment groups and diagnosis. Of the 170 patients who, according to randomisation allocation, should have been allocated to reboxetine, 39 received imipramine; of the 177 patients who should have been allocated to imipramine, 45 received reboxetine.

The frequency of randomisation errors was similar in the two treatment groups and in the two diagnostic subpopulations, MDD and DYS.

Assessment intervals

The summary statistics of the efficacy and safety assessment intervals in days from treatment start are shown in Table 7. There were a few deviations from scheduled times and were mainly related to laboratory tests and ECG evaluations at screening and at last assessment. The deviation rate was similar in both treatment groups.

Concomitant medications

The frequency of administration during the study of non-protocolled concomitant medications (because of their psychotropic properties) is given by active principle in

Table 8, and by class and diagnosis in Table 9. As shown in the latter table, long-acting benzodiazepines were administered to 34 reboxetine group patients and 35 imipramine group patients. Overall, unprotocolled psychotropic medications were administered to 35 reboxetine group patients and 37 imipramine group patients. Neuroleptics were administered to 6 reboxetine treated patients (4 of them in the MDD subgroup) and 1 imipramine treated patient. The main difference observed between the MDD and DYS subpopulations concerns the proportion of long-acting benzodiazepines, which were administered at least once more frequently to patients on reboxetine than on imipramine (14 and 9, respectively) in the DYS subgroup and more frequently to patients on imipramine than on reboxetine (26 and 20, respectively) in the MDD subgroup.

4.3 Demographic Data and Psychiatric Anamnesis

Summary statistics of demographic data are given by treatment group in Table 10 (age, weight and height by diagnosis) and Table 11 (race and sex by diagnosis), and summarised below.

Summary of Demographic Data

		Reboxetine		Imipramine	
		n	(%)	n	(%)
Sex	Female	137	77.8	126	73.7
	Male	39	22.2	45	26.3
	Total	176	100.0	171	100.0
Race	Caucasian	175	99.4	170	99.4
	Black	1	0.6	1	0.6
	Total	176	100.0	171	100.0
		mean	SD*	mean	SD*
Age (years)		73.8	6.4	74.5	7.0
Height (cm)		162.4	7.4	164.0	9.1
Weight (kg)		64.0	11.8	66.9	12.7

*SD standard deviation

The majority of patients, in both groups and subpopulations (MDD and DYS), were female; the ratio of females to males was similar in both groups of treatment. The vast majority of patients were Caucasian. The treatment groups and the two subpopulations were well-matched for age, height, weight, sex and race.

4.3.1 COGNITIVE FUNCTION

Summary statistics of the MMS total score are given by treatment and diagnosis in Table 12. There was no relevant difference between the treatment groups and the two subpopulations (MDD and DYS), at admission, with regard to the mean MMS total score.

4.3.2 DIAGNOSIS AND HISTORY OF THE DEPRESSIVE DISORDER

The frequency of the DSM-III-R diagnostic classifications, the summary statistics of the history of the depressive disorder, and the characteristics of the index episode are given by treatment, and diagnosis, in Tables 13 and 14. Major Depressive Disorders account for 62% and 64% of the reboxetine and imipramine study sample, whilst Dysthymia cases account for 38% and 36%, respectively. In the MDD subgroup, Recurrent Major Depressive Disorder (DSM-III-R 296.3) was diagnosed for 58% of the reboxetine and 67% of the imipramine subgroup patients, while the first Major Depressive Episode (DSM-III-R 296.2) was diagnosed more frequently (41%) in the reboxetine than in the imipramine subgroup (33%). One patient (reboxetine) was diagnosed as having Bipolar Depressive Disorder (DSM-III-R 296.5). In contrast, in the DYS subpopulation (see Table 14), the index episode represented the first occurrence of the disorder more frequently in the imipramine (34%) than in the reboxetine subgroup (24%). In addition, recurrence of a similar previous episode (probably corresponding to the DSM-III-R Dysthymia with intermittent course condition) was more frequently diagnosed in the reboxetine subgroup (22%) than in the imipramine subgroup (10%).

The age of onset, the median number of previous episodes of depression, the median duration of the last episode and the median duration of the present episode of the patients at entry into the study are shown below by diagnosis.

Previous History of Depression

	Major Depressive Disorder			
	Reboxetine		Imipramine	
	n	Median (range)	n	Median (range)
Age at onset (years)	100	67.0 (24 - 90)	102	67.0 (22 - 94)
Number of previous episodes	57	2.0 (1 - 18)	69	2.0 (1 - 40)
Duration of the last episode (weeks)	59	16.0 (4 - 172)	69	12.0 (3 - 676)
Duration of the present episode (weeks)	109	12.0 (2 - 188)	109	8.0 (1 - 128)

Previous History of Depression (continued)

	Dysthymia			
	Reboxetine		Imipramine	
	n	Median (range)	n	Median (range)
Age at onset (years)	55	66.0 (18 - 85)	55	68.0 (28 - 88)
Number of previous episodes	21	3.0 (1 - 12)	18	2.5 (1 - 12)
Duration of the last episode (weeks)	26	42.0 (4 - 208)	20	58.0 (4 - 156)
Duration of the present episode (weeks)	65	108.0 (2 - 2080)	62	104.0 (3 - 416)

The treatment groups were well matched with regard to the number of previous episodes of depression and the age at onset. In the MDD subgroup, the median duration of the last episode and the median duration of the present episode of depression were slightly lower in the imipramine group than in the reboxetine group, while in the DYS subgroup, the median duration of the last episode was slightly lower in the reboxetine group and the median duration of the index episode was similar in the two treatment groups.

As shown in Table 14, in the MDD subgroup, the onset of the index episode was acute or subacute in the majority of patients (64% and 62% of the reboxetine and imipramine subgroup patients, respectively). A precipitating external stress was absent more frequently in the imipramine group (59%) than in the reboxetine group (48%).

In the DYS subgroup, the index episode was characterised by exacerbation of chronic conditions in 52% and 57% of reboxetine and imipramine subgroup patients, respectively. The onset of the index episode was defined as insidious in the majority of the patients (66% of both the reboxetine and imipramine subgroup patients), although 3 patients in the reboxetine subgroup were reported to have had an acute onset of the Dysthymia disorder. A precipitating external stress was absent more frequently in the reboxetine group (64%) than in the imipramine group (58%).

4.3.3 SEVERITY OF DEPRESSION

The severity of the depression, according to the HAMD, MADRS and CGI scales, at the various assessment intervals during the study is displayed, in terms of summary statistics, in Tables 22 to 40 and summarised below. There was no significant difference between the treatment groups and the diagnosis at Day 0 with regard to the initial CGI and MADRS scores. Similarly, there were no significant group differences for the mean HAMD total scores in the whole population and in the two subgroups. On the whole, the

Pharmacia

Document 9550089

proportion of severe cases (maximum score level 2 or 3 to 4) for each item of the HAMD scale at baseline (Table 23) was similar in the two treatment groups for the vast majority of items with the only exception of **Insomnia Early** (score 2: 51% of imipramine vs 63% of reboxetine patients). In the subpopulations, though no significant group difference was observed for the mean HAMD total scores, the frequency of the severe cases (maximum score levels 2 or 3 to 4) was slightly different for few items, particularly in the DYS subgroup.

In the DYS subgroup, major differences were observed for **Anxiety Somatic** (score 3 to 4: 15% of imipramine vs 25% of reboxetine patients), **Somatic Gastrointestinal** (score 2: 15% of imipramine vs 31% of reboxetine patients), **Somatic General** (score 2: 43% of imipramine vs 52% of reboxetine patients) and for **Hypochondriasis** (score 3 to 4: 15% of imipramine vs 28% of reboxetine patients). In the MDD subpopulation, differences were seen for **Insomnia Early** (score 2: 54% of imipramine vs 71% of reboxetine patients) and **Insomnia Middle** (score 2: 39% of imipramine vs 53% of reboxetine patients).

Severity of Depression at Day 0

	Major Depressive Disorder					
	Reboxetine			Imipramine		
	n	mean	SD*	n	mean	SD*
HAMD	105	27.0	4.9	108	26.9	5.4
MADRS	104	30.7	7.7	108	31.2	6.8
		n	(%)		n	(%)
CGI Severity						
Normal		0	(0%)		0	(0%)
Borderline mentally ill		0	(0%)		0	(0%)
Mildly ill		11	(10.3%)		6	(5.5%)
Moderately ill		21	(19.6%)		29	(26.6%)
Markedly ill		55	(51.4%)		51	(46.8%)
Severely ill		19	(17.8%)		21	(19.3%)
Extremely ill		1	(0.9%)		2	(1.8%)

* SD standard deviation

4.3.5 MEDICAL HISTORY

The medical history and medical examination findings at entry of the study are summarised by single disease entity and diagnosis in Table 16, and by affected body system and diagnosis in Table 17. The majority of the patients had a history or presence of diseases other than the affective disorder at admission, the most common being circulatory system disorders, specifically hypertension (19% reboxetine, 22% imipramine). Circulatory system disorders were more frequently present in imipramine patients (45%) than in reboxetine patients (38%). The difference was mainly evident in the MDD subpopulation (44% vs 34%). On the contrary, digestive system disorders were more frequently present in the reboxetine than in the imipramine group patients, in the MDD subpopulation (23% vs 16%, respectively). No other imbalances among the two treatment groups and the two diagnoses are apparent.

5. STUDY MEDICATION AND COMPLIANCE

The frequency of administration of different doses of each experimental treatment on each study day is given by treatment in Table 18. The per protocol dose was administered to the vast majority of the patients. On Day 1, 15/176 (8.5%) of the reboxetine group patients and 18/171 (10.5%) of the imipramine group patients received half of the protocolled number of daily capsules, because they started their treatment in the evening. This resulted in a Day 1 dose of 2 mg of reboxetine and 25 mg of imipramine. In addition, one patient in the imipramine group received, in error, 150 mg imipramine on Day 1 due to a mistaken intake of a double number of capsules in the morning and evening of the 75 mg dose. Over the next few days a maximum of 9 and 8 patients per day (reboxetine and imipramine group, respectively) had their number of daily capsules decreased (for the reasons indicated in the individual data listing for the experimental treatment). These were mainly missed intake, lost medication or emergence of signs/symptoms of intolerance. Over the same period, a maximum of 2 patients per day on reboxetine (one in each diagnostic subpopulation) and 1 on imipramine (in the MDD subgroup) had their daily dose increased to 6 mg/day reboxetine and to a maximum of 150 mg/day imipramine. These were due to a mistaken intake of twice the expected number of capsules in the morning and/or evening.

As summarised in Table 19, at the end of the initial 3 weeks of treatment, 42 patients in the reboxetine group (23.9% of those admitted) and 33 of the imipramine group (19.3% of those admitted) had their daily dose increased according to the protocol provisions to a dose corresponding to 6 mg/day of reboxetine and 100 mg/day of imipramine (level 2 dose). In the following weeks, 8 additional patients on reboxetine and 7 on imipramine were switched to dose level 2. On the whole, a slightly higher proportion of reboxetine treated patients switched to the high dose regimen in both DYS and MDD subpopulations.

Over the last five weeks, a maximum of 6 patients per day in the reboxetine group and a maximum of 6 patients in the imipramine group, had their number of daily capsules decreased (for the reasons indicated in the individual data listing for the experimental treatment). These were mainly missed intake, lost medication or emergence of signs/symptoms of intolerance.

During the same period, on a few treatment days, a maximum of 1 patient per day on both reboxetine and imipramine mistakenly had their daily dose increased to a maximum of 10 mg/day reboxetine and a maximum of 150 mg/day imipramine, due to intake of twice the number of expected capsules in the morning and/or evening. In both treatment groups one patient per group was treated up to Day 63; on reboxetine this was achieved by dispensing the capsules of missing intake and on imipramine this was achieved by dispensing the spare capsules.

Pharmacia

Document 9550089

In the case of overdosage, signs of intolerance were reported only with reboxetine and consisted, in one case, of moderate insomnia (see Adverse Event Section).

Comparison of the daily dose administered (as reported in the compliance section of the CRF in terms of number of capsules taken per day) with the expected dose (as indicated in the Experimental Treatment Section of the CRF in terms of number of capsules foreseen per day) allowed calculation of the compliance with the treatment regimen. Full compliance was defined where there was full agreement between the dose prescribed (the per protocol dose, or a lower prescribed dose mainly in the case of adverse events) and the dose reported to have been taken. The total compliance over the treatment period was calculated for each patient and the patients were classified accordingly (Table 20). One hundred per cent compliance was reported in 61.4% of the reboxetine group patients and 67.8% of the imipramine group patients. Only in a few cases the reported compliance was lower than 80%, or between 80% and 89% (6 reboxetine treated patients, and 2 imipramine treated patients, in both instances).

A higher proportion of patients with full compliance was reported in DYS subpopulation compared to MDD subgroup in both treatment groups (70% vs 56% on reboxetine and 74% vs 64% on imipramine). In addition, in DYS subgroup a compliance lower than 90% was reported only in the reboxetine group (5 patients).

6. CONCOMITANT MEDICATIONS

The frequency of patients who received medications before the study start and during the treatment period as a newly introduced concomitant medications for treatment of emergent events, is shown in Table 21 by active principle and diagnosis and in Table 21a by class of drugs grouped according to the ATC System Classification and diagnosis.

As shown in Table 21a, the frequency of patients who were receiving at least one medication at admission to the study was similar in the reboxetine and imipramine groups for each class of drugs. During the study, the main difference between treatment groups was seen in the DYS subpopulation for central nervous system drugs, received by 19% and 3% of reboxetine and imipramine treated patients, respectively. Among those patients, as shown below, the vast majority of reboxetine patients and all imipramine patients received psycholeptic drugs (15% and 3%, respectively), including long-acting benzodiazepines, as already mentioned in Section 4.2.

A similar proportion of reboxetine and imipramine patients was receiving cardiovascular drugs at admission, though cardiovascular disorders were more frequently present in imipramine than in reboxetine patients and being the difference particularly evident in the MDD subpopulation, as previously discussed in Medical history (Section 4.3.5). However, as shown below, a higher proportion of patients on imipramine than on reboxetine received cardiac therapy at admission in the MDD subpopulation and beta-blocking agents in the DYS subgroup. During the study, in the MDD subpopulation, at least one newly introduced cardiovascular drug was administered to 7% of imipramine patients and 4% of reboxetine patients and, as shown below, particularly cardiac therapy was administered more frequently to imipramine than to reboxetine treated patients (5% vs 1%).

Percent frequency of patients taking at least one central nervous system or cardiovascular system medication

		Before Treatment				During Treatment

7. EFFICACY RESULTS

7.1 Hamilton Depression Rating Scale

Summary statistics of HAMD assessment at each visit in the observed cases are shown in Table 22 (total scores) Table 23 (frequency distribution of items scores) and Table 24 (factors). Summary statistics of the last assessment are given in Table 25 (total scores) and Table 26 (factors). The mean difference of HAMD total score between the two treatments at last assessment and the 95% CI is shown in Table 27. The mean HAMD total score was reduced from 26.6 at Day 0 to 14.8 at last assessment (mean decrease 11.8, SD 10.0), in the 172 patients treated with reboxetine who had at least one assessment in addition to baseline (4 patients had only baseline data), and to 11.4 at Day 56 in the 127 patients who completed the study. In the 168 patients treated with imipramine who had at least one assessment in addition to the baseline (3 patients had only baseline data) the mean HAMD total score was reduced from 26.1 at Day 0 to 12.9 at last assessment (mean decrease 13.3, SD 9.7), and to 8.8 at Day 56 in the 126 patients who completed the study. The difference between the two treatments in the mean HAMD decrease at last assessment was of -1.5 points (95% CI, -3.6 ÷ 0.6 points).

The mean decrease at last assessment in the MDD subpopulation was similar on reboxetine and imipramine, being the between treatment difference of -0.4 points (95% CI, -3.2 ÷ 2.4 points). In the DYS subpopulation a difference in favour of imipramine was present: -3.4 points (95% CI, -6.5 ÷ -0.2 points), being the mean HAMD decrease at last assessment 11.1 (SD 9.4) on reboxetine and 14.5 (SD 8.5) on imipramine (Table 27).

The pattern of improvement of HAMD factors was similar in the reboxetine-treated and imipramine-treated patients. On the whole, at last assessment, the only difference seen was in Factor V (Retardation) (median difference vs Day 0 of 0.75 [reboxetine group] and 1.25 [imipramine group]). A similar difference was present in the MDD and DYS subgroups. In the DYS subpopulation, small differences were also seen in Factor I (Anxiety/Somatisation) (median difference vs Day 0 of 0.67 [reboxetine group] and 0.83 [imipramine group]) and Factor VI (Sleep Disturbance) (median difference vs Day 0 of 0.33 [reboxetine group] and 0.67 [imipramine group]).

Absolute and per cent frequency of patients who fulfilled the definition of response or remission is shown (with 95% confidence intervals) by treatment group over time in Table 28 and at last assessment in Table 29. A slightly higher proportion of patients treated with imipramine were classified as responder or in remission at the end of the study. A similar pattern of response and remission rate was observed in the MDD and DYS subpopulations during and at the end of the study.

At last assessment (Table 29), 54.1% (95% CI, 46.3% ÷ 61.7%) of the reboxetine-treated patients and 56.5% (95% CI, 48.7% ÷ 64.2%) of the imipramine-treated patients

were classified as responders, according to the definition of response based on 50% decrease of HAMD score, while 42.4% (95% CI, 35.0% ÷ 50.2%) and 49.4% (95% CI, 41.6% ÷ 57.2%), respectively, were seen to be in remission. The proportion of response and remission cases was very similar on imipramine and on reboxetine in the MDD subgroup. Instead, the proportion of response [65.0% (95% CI, 51.6% ÷ 76.9%) on imipramine vs 56.7% (95% CI, 44.0% ÷ 68.8%) on reboxetine] and remission cases [58.3% (95% CI, 44.9% ÷ 70.9%) vs 41.8% (95% CI, 29.8% ÷ 54.5%), respectively] was higher on imipramine than on reboxetine in the DYS subgroup of patients.

The frequency of remission and non remission cases by severity (maximum score level) at baseline for each of the 17 specific items of the HAMD scale is shown in Table 30. The frequency by severity of the last items of the HAMD scale is not presented in the table being those items, on the whole, less frequently scored and similarly in both treatment groups. On the whole, the proportion of patients eventually in remission was higher among the less severe cases at baseline for the vast majority of items, with few exceptions mainly severe at baseline in a small proportion of cases. However, for few items the proportion of patients eventually in remission was particularly low among severely ill patients at baseline. This was the case in both treatment groups for Insomnia Middle (39.1% of the patients in remission vs 60.9% not in remission among the severe cases on imipramine; 35.8% of the patients in remission vs 64.2% not in remission among the severe cases on reboxetine), Agitation (27.3% of the patients in remission vs 72.7% not in remission on imipramine; 22.2% of the patients in remission vs 77.8% not in remission on reboxetine) and, particularly in the reboxetine group, for Hypochondriasis (41.9% of the patients in remission vs 58.1% not in remission on imipramine; 15.0% of the patients in remission vs 85.0% not in remission on reboxetine). In all cases, the prevalence of severely ill patients at admission was higher in the reboxetine group than in the imipramine group, particularly in the case of Insomnia Middle (46.0% vs 37.4%) and Hypochondriasis (22.7% vs 18.1%).

These results are consistent in the two diagnostic subpopulations. However, extreme differences are apparent in Dysthymia in both treatment groups for Insomnia Middle (36.4% of the patients eventually in remission vs 63.6% not in remission among the severe cases on imipramine; 28.0% of the patients in remission vs 72.0% not in remission among the severe cases on reboxetine) and Agitation (28.6% of the patients in remission vs 71.4% not in remission on imipramine; 0.0% of the patients in remission vs 100.0% not in remission on reboxetine) and, in the reboxetine group, for Hypochondriasis (5.3% of the severe patients eventually in remission vs 94.7% not in remission). In the latter case the prevalence of severely ill patients at admission was higher in the reboxetine group (28.4%) than in the imipramine group (14.5%).

7.2 Clinical Global Impression

7.2.1 SEVERITY OF ILLNESS

The distribution of the CGI severity scores at each visit in the observed cases is presented by treatment group in Table 31, while the distribution of the scores at last assessment during the study are provided in Table 32. The distribution pattern is similar in both treatment groups. At last assessment, the proportion of normal or borderline mentally ill cases was slightly lower on reboxetine (42.0%) than on imipramine (49.4%), while the proportion of mildly ill patients was higher in the reboxetine group (21.3%) compared to the imipramine group (10.6%). In the MDD subgroup, the proportion of normal or borderline mentally ill cases was similar in the reboxetine and imipramine groups, while the proportion of mildly ill cases was slightly higher on reboxetine (17.8% vs 11.9%) and the proportion of markedly to extremely ill patients was slightly higher on imipramine (27.5% vs 24.3%). In the DYS subpopulation, the proportion of normal or borderline mentally ill cases was higher on imipramine (62.3% vs 41.8%), while the proportion of mildly ill cases was higher on reboxetine (26.9% vs 8.2%).

A shift table of the last value vs Day 0 (Table 33) showed that the CGI Severity of Illness had decreased in 71.3% of reboxetine group patients, increased in 9.8% and remained the same for 19.0%, whereas the CGI Severity of Illness had decreased in 71.2% of imipramine group patients, increased in 5.3% and remained the same in 23.5%. The proportion of patients showing a decreased CGI Severity of Illness was higher in the DYS subpopulation than in the MDD subgroup of patients in both treatment groups, particularly on imipramine (80.3% vs 66.1%) but also on reboxetine (76.1% vs 68.2%).

7.2.2 GLOBAL IMPROVEMENT

The distribution of Global Improvement scores in CGI at each visit is shown by treatment group in Table 34. The distribution of last assessment scores is shown in Table 35. The proportion of patients judged 'much to very much improved' at last assessment and the between treatment difference (95% CI) are given in Table 36.

The overall distribution pattern was similar in the two treatment groups. The percentage of patients who were 'much to very much improved' was, at last assessment, 56.9% in the reboxetine group and 59.4% in the imipramine group. The between treatment difference at last assessment was -2.5% (95% CI, -12.9% ÷ 7.9%).

In the MDD subpopulation, the percentage of patients who were 'much to very much improved' was, at last assessment, slightly higher in the reboxetine group (58.9%) than in the imipramine group (52.3%). The between treatment difference at last assessment was 6.6% (95% CI, -6.0% ÷ 19.8%).

In the DYS subpopulation, the percentage of patients who were 'much to very much improved' was, at last assessment, higher in the imipramine group (72.1%) than in the

Pharmacia

Document 9550089

reboxetine group (53.7%). The between treatment difference at last assessment was -18.4% (95% CI, -34.8 % ÷ -2.0%).

In agreement with the results obtained on the HAMD score, imipramine appeared to be more effective on patients with Dysthymia, while such a difference between treatments is not evident in patients suffering from MDD.

The concordance between the response evaluated according to CGI - Global Improvement classification and the response evaluated according to the HAMD total score decrease of $\geq 50\%$, was estimated. Only the patients rated for both the assessment instruments at last available assessment could be considered. The results are summarised in the table below.

Concordance between the response according to CGI-GI and HAMD scale

	Major Depressive Disorder		Dysthymia		Total	
	Imipramine	Reboxetine	Imipramine	Reboxetine	Imipramine	Reboxetine
Patients Evaluated	107	102	60	66	167	168
Responders*	52	55	37	32	89	87
Non Responders*	46	39	14	25	60	64
Concordance	98/107	94/102	51/60	57/66	149/167	151/168
%	92	92	85	86	89	90

* according to both HAMD and CGI-GI

In the overall population, the results of the two assessment instruments were concordant in 151 and 149 patients, respectively on reboxetine and on imipramine, therefore showing a concordance of $\geq 89\%$. Among those patients, 87 and 89, respectively, were classified as responders, while 64 and 60 patients, respectively, were classified as non responders according to the definitions based on both the HAMD scale and the CGI - Global Improvement. As shown in the table, the concordance was very similar on both treatments and slightly higher in the MDD subpopulation.

7.2.3 EFFICACY INDEX

The CGI Efficacy Index, which was assessed in order to relate therapeutic efficacy and tolerability, is shown by treatment group at each visit in Table 37. The distribution of last assessment values is shown in Table 38. At last assessment no global benefit (index: <1) was reported in 17.2% of the reboxetine patient group and 20.0% of the imipramine patient group. The proportion of cases where moderate to marked efficacy was present in the absence of side-effects (index: 3 to 4) was similar in the two treatment groups (39.7% on reboxetine and 41.2% on imipramine). However, in the MDD subpopulation the proportion of patients in the latter condition corresponded to 40.2% of the cases on reboxetine vs 34.9% of the cases on imipramine. In contrast, in the DYS subpopulation, this condition was judged to be present in 52.5% of the patients on imipramine vs 38.8% of those on reboxetine.

7.3 Montgomery and Asberg Depression Rating Scale

Summary statistics of MADRS assessment at each visit in the observed cases are shown in Table 39 (total scores). Summary statistics of the last assessment are given in Table 40 (total scores).

The mean MADRS score was reduced from 29.7 at Day 0 to 15.5 at last assessment in the 171 reboxetine patients who had at least one assessment in addition to baseline, and to 11.7 in the 128 patients who had had the assessment at Day 56. In patients treated with imipramine, the mean MADRS score was reduced from 30.0 at Day 0 to 14.0 at last assessment in the 168 patients who had at least one assessment in addition to baseline, and to 8.9 at Day 56 in the 126 patients who completed the study.

The subgroup analysis of MADRS assessments shows a similar pattern of response in the MDD subpopulation. In the DYS subgroup of patients there was a suggestion of a higher reduction of the total score on imipramine than on reboxetine at last assessment (imipramine: from 27.9 to 9.8; reboxetine: from 28.0 to 14.6).

7.4 Geriatric Depression Rating Scale

Summary statistics of GDS assessment at each visit in the observed cases are shown in Table 41 (total scores). Summary statistics of the last assessment are given in Table 42 (total scores).

The mean GDS score was reduced from 23.1 at Day 0 to 14.0 at last assessment in the 172 reboxetine group patients who had at least one assessment in addition to baseline, and to 11.4 in the 128 patients who had the assessment at Day 56. In patients treated with imipramine, the mean total GDS score was reduced from 23.4 at Day 0 to 12.9 at last assessment in the 168 patients who had at least one assessment in addition to baseline, and to 9.2 in the 125 patients who had the assessment at Day 56. There were no clinically relevant differences in GDS scores at each visit between the reboxetine and

imipramine groups in the total population and in the subgroup populations. However, at last assessment, in the DYS subpopulation there was a suggestion of a higher reduction of the total score on imipramine than on reboxetine (imipramine: from 22.9 to 9.9; reboxetine: from 23.0 to 13.6).

7.5 Efficacy Conclusions

The efficacy of reboxetine therapy in elderly patients suffering from Depressive Disorders, as evaluated by the improvement of HAMD, CGI, MADRS and GDS scales, appeared not different to that of imipramine.

The results of the additional analyses on the subpopulations of patients diagnosed as having Major Depressive Episode/Disorder or Dysthymia, indicate that both treatments were similarly effective in terms of improvement of the clinical picture in the MDD subgroup of patients. In the DYS subpopulation, frequency and extent of improvement was higher on imipramine than on reboxetine.

8. SAFETY RESULTS

8.1 Safety Population and Extent of Exposure

8.1.1 NUMBER OF PATIENTS IN SAFETY ANALYSIS

All the patients who received study treatment were included in the safety analysis, i.e. 176 reboxetine patients and 171 imipramine patients. For the laboratory tests, vital signs and ECG, those patients with at least one assessment in addition to baseline were evaluated.

8.1.2 TOTAL DRUG EXPOSURE

As shown in Table 18, of the 176 and 171 patients exposed to reboxetine and imipramine, 143 and 138, respectively, were treated for at least 4 weeks, while 127 and 126 were treated for 8 weeks, therefore completing the study.

8.2 Adverse Events

8.2.1 ANALYSIS OF ADVERSE EVENTS

The number of patients with adverse events and the number of adverse events during the study are grouped by sex in Table 43, by age classes in Table 44, and by DSM-III-R diagnosis in Table 45. Sixty-eight point two per cent of the reboxetine-treated patients and 71.3% of the imipramine-treated patients had 307 and 338 adverse events and an average of 2.6 and 2.8 adverse events (per patient with adverse events), respectively. No relevant gender difference in the overall frequency of adverse events was present in either treatment groups (67.9% of females and 69.2% of males on reboxetine; 69.8% of females and 75.6% of males on imipramine). As for the different age groups, patients less than 70 years old at admission, and patients aged 70 to 79 years old, had adverse events slightly more frequently on imipramine than on reboxetine (79.3% and 73.8% respectively on imipramine; 63.2% and 69.4% respectively on reboxetine). In contrast, patients 80 years old or older suffered from adverse events more frequently on reboxetine than on imipramine (75.0% vs 58.3%).

Patients diagnosed as having Major Depressive Episode/Disorder (DSM-III-R 296.2 and 296.3) complained of adverse events somewhat more frequently on imipramine (73.4%) than on reboxetine (66.1%), while patients diagnosed as having Dysthymia (DSM-III-R 300.4) complained of adverse events slightly more frequently on reboxetine (71.6%) than on imipramine (67.7%). In both treatment groups, patients with the first major depressive episode (DSM-III-R 296.2) complained of adverse events more frequently than recurrent cases (DSM-III-R 296.3): 83.3% vs 68.5% on imipramine and 77.8% vs 58.7% on reboxetine.

8.2.1.1 End-Point Analysis

Results of the end-point analysis are summarised below. On the whole, the probability of developing at least one adverse event was similar in the two treatment groups and the odds ratio (OR: reboxetine/imipramine) was 0.86 (95% CI, 0.55 ÷ 1.36). No difference was apparent in the subpopulations, though in the MDD subgroup of patients the frequency of patients complaining of at least one adverse event was slightly higher on imipramine than on reboxetine [OR = 0.7 (95% CI, 0.39 ÷ 1.26) and in the DYS subpopulation this frequency was slightly higher on reboxetine than on imipramine [OR = 1.20 (95% CI, 0.57 ÷ 2.55)].

Frequency of patients complaining of at least one adverse event

	Major Depressive Disorder		Dysthymia		Total	
	Imipramine	Reboxetine	Imipramine	Reboxetine	Imipramine	Reboxetine
Patients Exposed	109	109	62	67	171	176
Patients with any AE	80	72	42	48	122	120
%	73	66	68	72	71	68
Odds Ratio (95% CI)	0.70 (0.39 ÷ 1.26)		1.20 (0.57 ÷ 2.55)		0.86 (0.55 ÷ 1.36)	

8.2.1.2 Absolute and Per Cent Frequency

The absolute and per cent frequency of patients suffering from adverse events and of adverse events is grouped by frequency and time interval in Tables 46 (all events), 47 (split by body system with relevant event grouped in clusters), 48 (split by body system, with relevant event grouped in clusters, and diagnostic subpopulations) and by body system and sex in Table 49. The relative chance of developing at least one adverse event among the most frequent of reported events in the two treatment groups (≥5% of exposed patients in at least one group) is evaluated by OR and shown in Table 50. The frequency of the events often reported in patients on antidepressant medication was very similar in the two treatment groups. Dry mouth was complained of by 22.2% and 22.8% of patients on reboxetine and on imipramine, respectively; constipation by 17.6% and 18.1% of patients, respectively; nausea and related symptoms by 11.4% and 9.9%, respectively; increased sweating by 9.1% and 8.8% of patients, respectively; headache/migraine by 6.3% and 5.3% and urinary hesitancy/retention by 4.0% and 5.8%, respectively. Accordingly, the odds ratios were very close to 1 (Table 50). Insomnia was the only event more frequently reported on reboxetine than on imipramine [6.3% vs 2.9%; OR = 2.25 (95% CI, 0.78 ÷ 6.51)]. Hypotension and related symptoms were

more frequently reported on imipramine than on reboxetine (15.8% vs 7.4%) and the odds ratio [OR = 0.43 (95% CI, 0.21 ÷ 0.85)] indicates that the chance of developing hypotension and related symptoms was higher on imipramine than on reboxetine.

Amongst the most frequently reported events, few differences were seen between the two diagnostic subpopulations (Table 48). In the MDD subpopulation, the most relevant differences were related to the frequency of dry mouth, more frequently reported on imipramine than on reboxetine (22.9% vs 16.5%, respectively); hypotension and related symptoms (20.2% on imipramine vs 10.1% on reboxetine) and tachycardia (4.6% on imipramine vs 1.8% on reboxetine). In the DYS subpopulation, events more frequently reported on reboxetine than on imipramine were: dry mouth (31.3% vs 22.6%, respectively); insomnia (6.0% vs 0%, respectively); tremor (6.0% vs 1.6%, respectively), while events more frequently reported on imipramine than on reboxetine were: constipation (17.7% vs 13.4%, respectively); hypotension and related symptoms (8.1% vs 3.0%, respectively); urinary hesitancy/retention (8.1% vs 1.5%, respectively) and somnolence (4.8% vs 0%, respectively).

The most relevant between-gender difference (Table 47) was related to the frequency of hypotension and related symptoms, which were complained of mainly by male patients in both treatment groups (22.2% of male patients vs 13.5% of female patients on imipramine; 10.3% of male patients vs 6.6% of female patients on reboxetine) and urinary hesitancy/retention, which was complained of mainly by male patients in both treatment groups (15.6% of male patients vs 2.4% of female patients on imipramine; 10.3% of male patients vs 2.2% of female patients on reboxetine). Increased sweating was complained of mainly by female patients in both treatment groups (10.9% of female patients vs 2.6% of male patients on reboxetine; 10.3% of female patients vs 4.4% of male patients on imipramine). Dry mouth was complained of mainly by female patients on reboxetine (24.8% of female patients vs 12.8% of male patients).

The most frequent, therefore, were disorders of the gastrointestinal (GI) system (31.8% and 30.4% on reboxetine and imipramine, respectively) and autonomic nervous system (NS) (27.3% and 28.7%, respectively). Cardiovascular (CV) disorders more frequently affected patients on imipramine than on reboxetine (21.1% vs 12.5%, respectively), and this was also true for urinary system disorders (12.3% vs 8.5%) and general disorders (11.7% vs 6.8%). Psychiatric disorders affected more frequently patients on reboxetine than on imipramine (13.6% vs 9.9%) (Table 49).

As more patients on imipramine than on reboxetine suffered from cardiovascular disorders at admission (45% vs 38%, respectively), as already discussed in Medical History (Section 4.3.5), the frequency of patients affected by at least one cardiovascular adverse event was investigated in patients with or without cardiovascular disorders at baseline. Results are summarised below.

Pharmacia

Document 9550089

Frequency of patients complaining of at least one cardiovascular event or hypotension and related symptoms among patients with or without cardiovascular disorders at baseline

Baseline CV Disorders		Cardiovascular Adverse Events		Hypotension and Related Symptoms	
		Imipramine	Reboxetine	Imipramine	Reboxetine
Absent	Patients Exposed	94	109	94	109
	Patients with AE	16	14	11	10
	%	17	13	12	9
Present	Patients Exposed	77	67	77	67
	Patients with AE	20	8	16	3
	%	26	12	21	5

In patients with or without cardiovascular disorders at admission, the frequency of cardiovascular adverse events was higher on imipramine than on reboxetine. However, while the presence of cardiovascular disorders at baseline seemed not to facilitate the emergence of cardiovascular adverse events and, in particular, of hypotension and related symptoms, on reboxetine, patients on imipramine suffered from newly emerged cardiovascular adverse events and, in particular, of hypotension and related symptoms, more frequently when affected by cardiovascular disorders at baseline (26% and 21%, respectively) than when not affected (17% and 12%, respectively). The differences in favour of reboxetine are mainly evident in the former population (12% vs 26% for cardiovascular adverse events and 5% vs 21% for hypotension and related symptoms).

On the whole, imipramine-treated patients suffered from newly emerged cardiovascular adverse events more frequently than reboxetine-treated patients; nevertheless, only 5% of patients exposed to imipramine vs 3% of those exposed to reboxetine received at least one cardiovascular concomitant drug during treatment (Table 21a).

8.2.1.3 Occurrence

The occurrence of adverse events is grouped by week of onset and event or body system in Tables 51, 52 and 53. The most frequent events on reboxetine and on imipramine emerged early during treatment (within the first week): gastrointestinal disorders (47.5%

and 41.1% on reboxetine and imipramine, respectively), autonomic nervous system disorders (56.1%, 59.3%) and psychiatric disorders (26.5%, 42.1%).

There was a suggestion that general cardiovascular disorders occurred slightly sooner in the imipramine group (first week 49.0%, second week 10.2%) compared to the reboxetine group (first week 29.2%, second week 25.0%). This was mainly due to hypotension and related symptoms, the frequency of which was high during the first and second week on reboxetine (35.7% and 21.4%, respectively), while it was more frequently reported during the first week on imipramine (47.1% vs 8.8% during the second week).

8.2.1.4 Cumulative Risk for Individual Events

The cumulative risk of developing individual events or cluster of individual events, reported in $\geq 5\%$ patients in at least one treatment group, was described according to the Kaplan-Meier method and analysed by the log-rank test. Results are presented only for events with a significantly different risk between the two treatment groups, while the analysis and figures corresponding to all the other events are enclosed in Appendix 12.1.1.1. On the whole, the only difference seen concerned the cumulative risk of developing hypotension and related symptoms, which was significantly higher ($p = 0.0142$) on imipramine than on reboxetine (Figure 1). This result was confirmed in the MDD subpopulation ($p = 0.0326$) but not in the DYS subgroup. No other significant differences were seen in the two subpopulations.

8.2.1.5 Dose Relationship

The absolute frequency of adverse events is grouped by maximal severity and by dose taken on the onset day and in the three preceding days in Table 54. There is no indication that any event occurred at an increased severity or frequency in patients (Tables 18, 19) switched according to the protocol to the higher dose level of reboxetine (corresponding to 6 mg/day) and of imipramine (corresponding to 100 mg/day), with the exception of mild/moderate headache and mild urinary hesitancy in the imipramine group.

8.2.1.6 Maximal Severity

The maximal severity of adverse events in each patient is grouped by sex, age and DSM-III-R classification in Table 55, by event or body system in Tables 56 and 57, respectively, and by body system and diagnosis in Table 58. The prevalence of at least one moderate or severe event was higher on imipramine (73.0%) than on reboxetine (65.0%). Female patients had moderate to severe adverse events more frequently than male patients on imipramine (80.7% vs 52.9%) but not on reboxetine (64.5% vs 66.7%). Mild events were more frequently reported by patients on reboxetine than by patients on imipramine (35.0% vs 27.0%, respectively). There was an increased prevalence of severe adverse events with age in both groups, from 14.0% of patients with events aged < 70 years to 48.1% of patients aged ≥ 80 years in the reboxetine groups, and 21.7% of

patients with events aged < 70 years to 57.1% of patients aged ≥ 80 years in the imipramine group.

However, in both groups, mildness characterised the severity of events for the most frequently affected body systems: 39.3% and 48.1% of the patients on reboxetine and imipramine, respectively, for GI disorders, 50.0% and 44.9% for autonomic NS disorders and 40.0% and 33.3% for central and peripheral NS disorders (Table 57). Possible exceptions were the events related to CV disorders, most frequently moderate on reboxetine (45.5%) and mild on imipramine (36.1%), though severe events were reported more frequently on imipramine (33.3% of the affected patients) than on reboxetine (22.7%); and the events related to psychiatric disorders (mainly agitation/anxiety/nervousness), most frequently severe on reboxetine (41.7%) and mild on imipramine (52.9%).

On the whole, the severity of adverse events was not different in the diagnostic subgroups on both reboxetine and imipramine with the exception of severe events, more frequent in the MDD than in the DYS subgroup on both reboxetine and imipramine (33.3% vs 25.0% and 33.8% vs 26.2%, respectively), and of mild events more frequent in the DYS subgroup on reboxetine (39.6% vs 31.9% in the MDD subgroup) (Table 58). In addition, events related to cardiovascular disorders were more frequently severe in DYS than in MDD patients on imipramine (42.9% vs 31.0%).

8.2.1.7 Duration

Summary statistics of the duration of adverse events are described in Table 59. The median duration was 10 days for reboxetine and 8 days for imipramine. Among the most frequent events, the median duration was higher in the reboxetine group than in the imipramine group for dry mouth (24 days, 19 days), and tachycardia (29 days, 10 days). The median duration was higher in the imipramine group than the reboxetine group for urinary tract infection (14 days, 8 days), somnolence (12 days, 7 days), urinary hesitancy (34 days, 13 days) and anorexia (19 days, 7 days).

8.2.1.8 Symptomatic Treatment

As shown in Table 60, 24.8% and 23.4% of the events on reboxetine and imipramine, respectively, required symptomatic treatment in 38.3% and 32.8% of the affected patients. Urinary tract infection in both treatment groups, and hypotension on imipramine, were the events most likely to require symptomatic treatment.

8.2.1.9 Modification of Study Medication and Patient Outcome

As shown in Table 61, no change in study medication was required for 76.5% and 70.4% of the events on reboxetine and on imipramine, respectively, while the daily dose was reduced in 2.3% and 1.2% of the cases, respectively, or the treatment temporarily interrupted in 2.0% and 2.4%. According to the adverse event outcome reported by the

investigators, 17.6% and 21.9% of the cases in the reboxetine and imipramine groups, respectively, contributed to withdrawal. Among the most common events, this was most frequently seen on reboxetine and on imipramine for hypotension and related symptoms (3 out of 14 events and 7 out of 34 events, respectively), for increased sweating (5 out of 16 events on both treatment groups) and for urinary hesitancy/retention (3 out of 8 events and 8 out of 10 events, respectively). In the case of fall, 1 out of the 3 events on reboxetine and 3 out of the 9 events on imipramine contributed to withdrawal.

The individual cases of patients withdrawn due to adverse events are described in Section 8.2.3.2.

As shown in Table 62, of the 67 and 86 events requiring modification of the study medication in the reboxetine and imipramine group, 50.7% and 66.3% respectively, disappeared following the modification of the regimen, while 38.8% and 19.8%, respectively, did not change. The patient outcome, grouped by event and action taken on study medication in Table 63, corresponds to full recovery in 50.7% of the reboxetine and 72.1% of the imipramine cases following modification of the treatment regimen, the event being still present at last observation in 41.8% and 20.9%, respectively. In particular, 77.8% of the cases of hypotension and related symptoms (7 out of 9 events) on imipramine vs 20.0% of the cases on reboxetine (1 out of 5 events) recovered following the modification of the regimen, suggesting a more close correlation with imipramine than with reboxetine. Similarly, 87.5% and 66.7% cases of urinary hesitancy/retention were recovered following the modification of the regimen on imipramine and reboxetine, respectively.

Full recovery occurred in 67.9% of both reboxetine and imipramine cases following unchanged study medication, the event still being present at last assessment in 20.0% and 16.7%, respectively, of the latter cases.

8.2.1.10 Prevalence

The prevalence of adverse events is grouped by week of treatment and event, event cluster or body system in Tables 64, 65 and 66. Among the most frequent events, in keeping with the selection of the most tolerant population over the treatment period, the proportion of affected patients tended to decrease during treatment for dry mouth, nausea and insomnia in both treatment groups. However, in a number of the common events there was either no change over the treatment period (constipation, in both treatment groups; increased sweating and dizziness, in the reboxetine group) or there tended to be an increase during the treatment period (urinary hesitancy and increased sweating, in the imipramine group; tremor, in the reboxetine group).

The overall prevalence of adverse events in both treatment groups is shown in Figure 2. The proportion of patients affected by at least one adverse event during the different weeks of treatment was slightly higher on imipramine than on reboxetine, particularly in the intermediate weeks. This difference was more evident in the MDD subpopulation,

while in the DYS subgroup the prevalence of adverse events was higher on reboxetine than on imipramine during the initial 4 weeks of treatment.

8.2.1.11 Relationship Between Adverse Events and Study Medication

The relationship between adverse events and study medication, as judged by the investigators on the basis of Karch and Lasagna modified criteria (Enclosure 11 of Appendix 12.1.1) is described in Table 67. The patients complaining of at least one adverse event with probable to definite relationship are tabulated in Table 68. The majority of events on reboxetine and imipramine (35.8%, 29.6%, respectively) were judged possibly related, while 28.3% and 29.3%, respectively, were judged probably related and 3.3% and 9.2%, respectively, were judged definitely related. On the whole, therefore, 38.5% of the events which emerged on imipramine were judged definitely/probably related to the drug, compared to 31.6% of the events which emerged on reboxetine. Among the most frequent events, the maximal frequency of definite/probable relationship was present (reboxetine and imipramine) for dry mouth (58.5%, 72.1%), constipation (38.9%, 35.7%), nausea and related symptoms (40.9%, 50.0%) and urinary hesitancy/retention (62.5%, 80.0%) and on imipramine for hypotension and related symptoms (50.0% vs 28.6%).

As shown in Table 68, the proportion of patients complaining of at least one adverse event with probable to definite relationship was higher on imipramine (42.7%) than on reboxetine (33.0%). Among the most frequent events, this proportion was slightly higher on imipramine than on reboxetine for dry mouth (17.5% vs 13.6%, respectively), hypotension and related symptoms (8.8% vs 2.3%, respectively) and urinary hesitancy/retention (4.7% vs 2.3%, respectively). These differences were more evident in the MDD subgroup for dry mouth (17.4% vs 10.1% on reboxetine) and hypotension and related symptoms (11.9% vs 3.7% on reboxetine) and in the DYS subpopulation for urinary hesitancy/retention (8.1% vs 1.5% on reboxetine).

8.2.1.12 Adverse Events Occurred in Patients with Creatinine Clearance < 30 ml/min

Seven patients on reboxetine and 10 patients on imipramine (Table 5) were admitted to the study with a calculated creatinine clearance of < 30 ml/min, suggestive of moderate to medium renal insufficiency with a possibility of this leading to interference with the elimination of both compounds, both of which have urinary excretion as the preferential elimination route. On reboxetine 5/7 patients and on imipramine 5/10 patients had, respectively, 10 and 20 adverse events, being the frequency of event per patient higher on imipramine than on reboxetine. Two patients on imipramine suffered from 3 serious adverse events (sudden faint, fracture of the neck of the femur following a fall, drowsy and jerky movements in legs).

8.2.2 ADVERSE EVENT SUMMARY

Of the 176 reboxetine patients and 171 imipramine patients who received study medication, 120 (68.2%) and 122 (71.3%) patients reported a total of 307 and 338, adverse events, respectively (2.6 and 2.8 average per patient with adverse events) (Table 43). On the whole population, the probability of developing at least one adverse event was similar in the two treatment groups. Overall, no statistical difference was found in the subpopulations, though in the MDD subgroup the frequency of patients complaining of at least one adverse event was slightly higher on imipramine than on reboxetine, while in the DYS subgroup this frequency was slightly higher on reboxetine than on imipramine. Insomnia was the only event more frequently reported on reboxetine than on imipramine [6,3% vs 2,9%; OR = 2.25 (95% CI, 0.78 ÷ 6.51)]. Hypotension and related symptoms were more frequently reported on imipramine than on reboxetine (15.8% vs 7.4%) and the odds ratio [OR = 0.43 (95% CI, 0.21 ÷ 0.85)] indicates that the chance of developing them was higher on imipramine than on reboxetine. For the whole population, the prevalence of adverse events during the study indicates a slightly higher proportion of patients with adverse events in the imipramine group than in the reboxetine group, particularly in the intermediate weeks (Figure 2). This difference was more evident in the MDD subgroup, while in the DYS subgroup the prevalence of adverse events was higher on reboxetine than on imipramine during the initial 4 weeks of treatment.

8.2.2.1 Severity of Adverse Events

The maximum severity of adverse events is presented in Tables 55 to 57 and summarised as follows:

Severity of Adverse Events

No. of patients					
Reboxetine			Imipramine		
Mild	Moderate	Severe	Mild	Moderate	Severe
42	42	36	33	51	38

The majority of adverse events were mild or moderate in both groups. However, moderate to severe events were more common on imipramine than on reboxetine (89 patients vs 78, respectively).

8.2.2.2 Age- and Gender-Related Effects

No major gender-related differences in adverse events frequency were apparent (Table 43). As for the different age groups, patients less than 70 years old at admission, and patients aged 70 to 79 years, had adverse events slightly more frequently on

imipramine than on reboxetine (79% and 74% respectively on imipramine; 63% and 69% respectively on reboxetine). On the contrary, patients 80 years old or older suffered from adverse events more frequently on reboxetine than on imipramine (75% vs 58%) (Table 44). The most relevant between-gender difference was related to the frequency of hypotension and related symptoms, which were complained of mainly by male patients in both treatment groups (22.2% of male patients vs 13.5% of female patients on imipramine; 10.3% of male patients vs 6.6% of female patients on reboxetine) and urinary hesitancy/retention complained of mainly by male patients in both treatment groups (15.6% of male patients vs 2.4% of female patients on imipramine; 10.3% of male patients vs 2.2% of female patients on reboxetine). Increased sweating was complained of mainly by female patients in both treatment groups (10.9% of female patients vs 2.6% of male patients on reboxetine; 10.3% of female patients vs 4.4% of male patients on imipramine). Dry mouth was complained of mainly by female patients on reboxetine (24.8% of female patients vs 12.8% of male patients) (Table 47).

8.2.2.3 Frequently Reported Adverse Events

Adverse events which occurred in 5% or more of the patients of the MDD and DYS subpopulations during the study (Table 48), are presented by body system in the following table:

Pharmacia

Document 9550089

Adverse Events Occurring in 5% or More of Patients - MDD Subpopulation

Body system	Adverse event	Reboxetine (n=109)		Imipramine (n=109)

8.2.3 SERIOUS ADVERSE EVENTS, DEATHS AND ADVERSE EVENTS ASSOCIATED WITH WITHDRAWAL

8.2.3.1 Serious Adverse Events and Deaths

One patient died (suicide) during the study period and three died (bronchopneumonia, pulmonary edema and apoplexy) 12, 6 and 11 days, respectively, after the end of the treatment period. All deaths were on imipramine. In addition, 12 serious adverse events were reported, 2 under reboxetine and 10 under imipramine, complained of by 2 and 9 patients, respectively. On reboxetine, the 2 cases were: meningioma and acute confusional state and fall. On imipramine, 4 cases concerned cardiovascular disorders: postural hypotension, sudden faint, atrial fibrillation and right bundle branch block and A-V block first degree; in all cases patients were affected by relevant cardiovascular disorders at anamnesis. The other cases concerned: 2 cases of fracture of the neck of the femur, one of them following a fall; a fall and fracture of the knee; a convulsive episode; drowsy and jerky movements in legs and urinary retention.

On reboxetine, the acute confusional state followed by a fall caused discontinuation of the treatment, while the patient who was operated to remove the meningioma withdrew from the study for neurological worsening. On imipramine, 4 serious adverse events (sudden faint, right bundle branch block and A-V block first degree and the 2 cases of fracture of the neck of the femur) occurred during the treatment and one (atrial fibrillation) 7 days after the end of the treatment period. Five serious adverse events (postural hypotension, urinary retention, drowsy and jerky movements in legs, a convulsive episode and a fall and fracture of the knee) caused the treatment interruption.

Case histories for these patients are provided in Appendix 12.2.1.

8.2.3.2 Adverse Events Associated with Withdrawal

Forty-five patients (20 on reboxetine; 25 on imipramine) had adverse events or intercurrent illnesses as the main reason of withdrawal from the study (Table 69). In addition, on imipramine, 2 patients had adverse events as the main reason for withdrawal but the events (Number 3MD, Centre 35 - urinary tract infection; Number 4MD, Centre 381 - insomnia) were not present at the end of treatment, being recovered in association with symptomatic medication. Therefore, 20 patients on reboxetine (11.4%), and 27 patients on imipramine, (15.8% including the occurred death) had adverse events or intercurrent illnesses as the main reason for withdrawal. The nature of the adverse events is summarised as follows:

Pharmacia

Document 9550089

Adverse Events Associated with Withdrawal - MDD Subpopulation

Treatment	Centre no.-Patient no.	Adverse event	Relationship to study drug
Reboxetine	30-2, 32-5, 35-1	Increased sweating	Possible, Probable, Probable
	5-1, 32-5, 35-1	Dry mouth	Possible, Probable, Probable
	20-3, 46-4	Confusion	Probable, Probable
	30-2, 32-4	Headache	Probable, Probable
	15-111, 5-1	Urinary retention	Doubtful, Possible
	14-1, 32-5	Abdominal pain	Probable, Probable
	5-1, 35-1	Constipation	Possible, Probable
	36-19	Dizziness	Definite
	36-19	Nausea	Definite
	32-4	Insomnia	Probable
	293-12	Urinary hesitancy	Probable
	5-1	Neuropathy	None
	14-1	Anxiety	Probable
	25-1	Extrasystoles	Unknown
	32-4	Somnolence	Probable
	36-13	Hypokalaemia	Possible
	36-13	Arterial thrombosis	None
	381-2	Palpitations	Probable
	46-4	Fracture	Possible
	46-4	Pulmonary carcinoma	None
46-4	Fall	Possible	
Imipramine	6-2, 9-7, 382-10	Dizziness	Probable, Probable, Probable
	16-3, 31-1	Fall	Possible, Probable

Adverse Events Associated with Withdrawal - DYS Subpopulation

Treatment	Centre no.-Patient no.	Adverse event	Relationship to study drug
Reboxetine	5-4, 17-1	Nervousness	Doubtful, Possible
	35-7	Increased sweating	Possible
	17-1	Confusion	Possible
	381-3	Headache	Possible
	36-7	Dizziness	Possible
	36-7	Nausea	Possible
	5-4	Insomnia	Doubtful
	5-5	Hyperkinesia	Unknown
	35-7	Hypoaesthesia	Possible
	35-7	Neuritis	Doubtful
	381-3	Pain	Doubtful
Imipramine	382-7	Dizziness	Definite
	382-7	Fall	Definite
	382-7	Malaise	Definite
	382-7	Ataxia	Definite
	382-7	Fatigue	Probable
	5-10	Urinary retention	Probable
	16-1	Nausea	Possible
	16-3	Hypertension	Doubtful
	291-3	Pruritus	Probable
	36-5	Suicide attempt	None

Further 3 patients in the reboxetine group and 2 in the imipramine group withdrew from the study because of an adverse event/intercurrent illness, without this being a newly emerged adverse event, rather these were adverse events/ intercurrent illnesses present at baseline which persisted without increasing in severity during the treatment period. On reboxetine, Patient 2DT (Centre 42) dropped out due to agitation and insomnia which had already been reported at Day 0 at the same severity; similarly, Patient 9DT (Centre 382) withdrew because of insomnia which had started long before the treatment commenced. The third patient on reboxetine (1MD; Centre 3301) withdrew for suspected multiple myeloma which emerged from laboratory abnormalities noted at admission; the diagnosis was not confirmed by bone marrow analysis. On imipramine, Patient 2MD (Centre 46) dropped out due to lassitude which had already been present at Day 0, and Patient 7MD (Centre 35) withdrew due to a hysterectomy which had already been planned for the treatment of an endometrium carcinoma present at admission.

On the whole, general cardiovascular disorders contributed to the withdrawal of 9 patients on imipramine and 5 on reboxetine and autonomic nervous system disorders to the withdrawal of 3 patients on imipramine and 5 on reboxetine.

8.3 Laboratory Tests

8.3.1 SUMMARY STATISTICS OF LABORATORY VALUES

As shown in Table 70, in the reboxetine group, compared to baseline, there was a significant ($p < 0.01$) increase, after 4 and 8 weeks of treatment, in haemoglobin (median difference 0.10 g/dl and 0.18 g/dl) and platelets (median difference $13.57 \times 10^3/\text{mm}^3$ and $12.14 \times 10^3/\text{mm}^3$). In addition, there was a significant increase in alkaline phosphatase (median difference 4.47 U/l) after 8 weeks of treatment and in serum phosphate after 4 weeks of treatment (median difference 0.05 mEq/l). There was a significant decrease after 4 and 8 weeks of treatment in serum sodium (median difference -1.00 mEq/l and -0.91 mEq/l).

Similarly, in the imipramine group, compared to baseline, there was a significant increase, after 4 weeks of treatment, in erythrocytation rate (first hour and second hour) (median difference 1.50 mm/h and 2.50 mm/h). In addition, there was a significant increase in alkaline phosphatase (median difference 5.31 U/l and 8.15 U/l) after 4 and 8 weeks of treatment. Blood triglycerides and serum phosphate significantly increased (median difference 5.02 mg/dl and 0.05 mEq/l) after 8 weeks of treatment. Serum sodium and chloride significantly decreased after 4 weeks of treatment (median difference -1.00 mEq/l and -0.80 mEq/l).

8.3.2 URINALYSIS

Frequency of abnormal findings at baseline and during the treatment period or at last assessment are shown in Tables 71 and 72, respectively. No indication of increased frequencies of abnormal findings as compared to baseline emerges. In fact, there is no indication of increased proportions of patients shifted from baseline to presence of albumin, sugar, WBC and RBC compared to baseline both at the various assessment intervals (Table 73) and at last available assessment (Table 74). The same consideration holds for specific gravity (Tables 75 and 76).

8.3.3 ABNORMAL LABORATORY VALUES

The number and percentage of patients shifted from values within, below or above the normal range to values within, below or above the latter are given by period in Table 77. There were no statistically significant shifts ($p < 0.01$) in the distribution of the frequencies (either towards the higher or lower values) in the reboxetine group. In the imipramine group a statistically significant shift in the distribution of the frequencies toward lower values was found for serum sodium after 4 weeks of treatment and toward higher values for triglycerides after 8 weeks of treatment ($p < 0.01$; Maxwell's test).

8.3.4 ABNORMAL LABORATORY VALUES OF CLINICAL RELEVANCE

The distribution pattern of patients with clinically relevant abnormal values is given by variable and period of treatment in Table 78. Frequency of clinically relevant abnormal values was similarly low in the two treatment groups over the study period; no significantly increased frequency over baseline was present for any of the variables measured in the reboxetine and imipramine patient groups.

8.4 Vital Signs

8.4.1 BLOOD PRESSURE AND HEART RATE

Summary statistics of blood pressure and heart rate values and changes vs baseline at each visit during the study are presented in Tables 79 to 83. There were no important trends apparent in mean and median blood pressure and heart rate values and changes during the study.

The absolute and per cent frequency of patients showing at each visit a modification of 20% or more vs baseline is given in Table 81, while the frequency of patients showing such a modification accompanied by absolute critical values (≥ 160 or ≤ 100 mm Hg for systolic blood pressure; ≥ 100 or ≤ 70 mm Hg for diastolic blood pressure; ≥ 100 or ≤ 50 beats/min for heart rate) once, twice or more times is given in Table 82.

As shown in Table 81, as for the lying and standing systolic blood pressure, the proportion of patients showing a decrease was higher than those showing the opposite, the maximal difference being observed in standing position mainly on imipramine (3-10% vs 2-6% on reboxetine). As for the lying and standing diastolic blood pressure, the proportion of patients showing a decrease was similar to the proportion of patients showing an increase and this was observed in both treatment groups.

As shown in Table 82, the main difference between reboxetine and imipramine was observed in the absolute frequency of clinically relevant decrease, associated with the above described critical values, of diastolic blood pressure which was higher on imipramine than on reboxetine on standing (38 vs 22 cases, representing 22% and 13% of evaluated patients, respectively). In addition, the frequency of relevant decrease of both systolic and diastolic blood pressure on standing, was higher on imipramine than on reboxetine (10 vs 4 cases, respectively).

The frequency of relevant increase of systolic and diastolic blood pressure was similar in the two treatment groups; however, the maximal difference between reboxetine and imipramine was seen in the frequency of diastolic blood pressure increase, slightly higher in the reboxetine group in lying position (22 vs 11 cases, representing 13% and 7% of evaluated patients, respectively). The vast majority of relevant decreases and increases occurred occasionally (reported once).

As for the lying and standing heart rate, in both treatment groups the proportion of patients showing a decrease of possible clinical relevance was lower than the proportion of patients showing an increase. A similar proportion of patients with at least 20% increased values was observed during treatment in the reboxetine (5%-12% of patients) and imipramine groups (2%-10%) (Table 81).

As reported in Table 82, the absolute frequency of clinically relevant increase of heart rate, associated with values ≥ 100 beats/min, was higher in the reboxetine than in the imipramine group, the maximal difference being observed on standing (19 vs 10 cases, representing 12% and 6% of evaluated patients, respectively). The majority of those relevant increases occurred occasionally (reported once).

The number and percentage of patients with orthostatic hypotension at each visit is presented in Table 83. At baseline the event was present in 12 patients (7.1%) in the reboxetine group and 2 patients (1.2%) in the imipramine group. Subsequently, in the reboxetine group, the event had a frequency lower than baseline at all visits, affecting a maximum of 5.0% of patients on Day 14. In the imipramine group, the event affected a maximum of 6.5% of the patients on Day 7.

8.4.2 BODY WEIGHT

Summary statistics of the body weight values (Kg) at the various assessment intervals are given in Table 84, while the absolute and per cent frequency of patients showing higher (> 2.5 Kg), lower (< 2.5 Kg) or similar values vs baseline at the various assessment intervals is given in Table 85. No trends toward modification were apparent in the reboxetine and imipramine groups.

8.5 Electrocardiogram

As shown in Table 86, 290 patients had their ECG recorded at baseline, 29% of whom showed at least one ECG abnormality (29% reboxetine and 30% imipramine). During the study, 281 patients had their ECG recorded within the first 4 weeks of treatment (Days 1 to 28), and 245 within the next 4 weeks of treatment (Days 29 to 56). In the reboxetine group, 31% and 33% of the evaluated patients had at least one ECG abnormality recorded within the first 4 weeks and the next 4 weeks of treatment, respectively. The equivalent proportions in the imipramine group were 28% and 23%, respectively. As shown in Table 87, during the study, the frequency of normalisation of ECG recordings in patients with at least one abnormality at entry was always higher than the frequency of at least one newly emerged abnormality in patients with normal tracing at baseline in both treatment groups. At last assessment of the study (Table 88), of the 85 patients (43 reboxetine and 42 imipramine) who had had at least one abnormality at baseline, 16.3% on reboxetine and 40.5% on imipramine were reported as normal. Among the 205 patients (105 reboxetine and 100 imipramine) with normal tracings at baseline, 16.2% on reboxetine and 12.0% on imipramine showed at least one abnormality at last assessment.

The frequency of individual abnormalities at admission and during the study is shown by treatment group in Table 89. At screening, individual abnormalities are present in a maximum of 6.1% (sinus bradycardia, < 60 beats/min) of the 148 evaluated cases of the reboxetine and in 4.2% (left ventricular hypertrophy) of the 142 evaluated cases in the imipramine group. During treatment, the frequencies of all observed abnormalities were not modified to any significant extent in either treatment group. As shown in Table 90, at last assessment, for all abnormalities and both treatment groups, the proportion of newly observed cases among normal baseline cases is lower than the proportion of normalised cases among abnormal baseline cases. Newly emerged abnormalities occurred with a slightly higher frequency in the reboxetine compared with the imipramine group; the most common of these were sinus tachycardia (8 reboxetine and 5 imipramine cases), occasional ventricular ectopic beats (5 imipramine and 3 reboxetine cases) and left anterior hemiblock (6 reboxetine cases).

The frequencies of randomised patients with at least one abnormality by abnormality group during the study is shown in Table 91 and at last assessment in Table 92. At screening, from 6.8% (ischaemic signs) to 13.5% (rhythm disorders) of the evaluated patients in the reboxetine group and 4.9% (ischaemic signs) to 12.0% (rhythm disorders) in the imipramine group showed at least one abnormality of the indicated groups. During treatment, the frequencies were not modified to any significant extent in any of the treatment groups. As shown in Table 92, newly emerged abnormalities were related to rhythm disorders (11.7% and 6.4% of the patients with normal tracings for this disorder at baseline in the reboxetine and imipramine groups, respectively), conduction disorders (6.0% and 3.9%, respectively), ischemic signs (4.3% and 3.0%, respectively) or other disorders (2.2% of the patients in the reboxetine group). However, in all cases, the proportion of patients with newly emerged abnormalities was consistently lower than the proportion of normalised cases.

8.6 Safety Conclusions

All the 347 patients who received study treatment were included in the safety analysis (176 reboxetine, 171 imipramine).

The relative chance of developing at least one adverse event, adjusted by diagnosis, was similar in the two treatment groups. Overall, no statistical difference was found in the subpopulations, though in the MDD subgroup the chance of developing at least one adverse event was slightly higher on imipramine than on reboxetine and in the DYS subpopulation this probability was slightly higher on reboxetine than on imipramine. Insomnia was the only event more frequently reported on reboxetine than on imipramine [6.3% vs 2.9%; OR = 2.25 (95% CI, 0.78 ÷ 6.51)]. Hypotension and related symptoms were more frequently reported on imipramine than on reboxetine (15.8% vs 7.4%) and the odds ratio [OR = 0.43 (95% CI, 0.21 ÷ 0.85)] indicates that the chance of developing them was higher on imipramine than on reboxetine.

The occurrence of newly reported adverse events was similar in all groups during the study; 120/176 reboxetine group patients reported 307 adverse events compared with 122/171 imipramine patients who reported 338 adverse events. However, patients diagnosed as having Major Depressive Episode/Disorder (DSM-III-R 296.2 and 296.3) complained of adverse events somewhat more frequently on imipramine (73.4%) than on reboxetine (66.1%), while patients diagnosed as having Dysthymia (DSM-III-R 300.4) complained of adverse events slightly more frequently on reboxetine (71.6%) than on imipramine (67.7%). The prevalence of adverse events was slightly higher on imipramine than on reboxetine and this difference was more evident in the MDD subpopulation, while in the DYS subgroup the prevalence of adverse events was higher on reboxetine than on imipramine during the initial 4 weeks of treatment. Discontinuation due to newly emerged adverse events was more frequent on imipramine (15.8%) than on reboxetine (11.4%), mainly in the MDD subgroup of patients (19.3% vs 12.8%, respectively). On the whole, the frequency of the events often reported under antidepressant medication, was very similar in the reboxetine and imipramine group and only hypotension and related symptoms showed a risk of development significantly higher on imipramine than on reboxetine. This latter difference was confirmed in the MDD subpopulation but not in the DYS subgroup of patients.

Patients on imipramine suffered from newly emerged cardiovascular adverse events and, in particular, of hypotension and related symptoms, more frequently when affected by cardiovascular disorders at baseline (26% and 21%, respectively) than when not affected (17% and 12%, respectively), while on reboxetine the presence of cardiovascular disorders at baseline seemed not to facilitate the emergence of cardiovascular adverse events, in particular of hypotension and related symptoms. The differences in favour of reboxetine are mainly evident in the population with cardiovascular disorders present at admission (12% vs 26% for cardiovascular adverse events and 5% vs 21% for hypotension and related symptoms).

Moderate or severe adverse events were more frequent on imipramine than on reboxetine (73% vs 65%). Males and females suffered from adverse events with similar frequency on reboxetine and on imipramine. The most relevant between-gender difference was related to the frequency of hypotension and related symptoms and urinary hesitancy/retention (complained of mainly by male patients in both treatment groups); increased sweating (complained of mainly by female patients in both treatment groups); and dry mouth (complained of mainly by female patients on reboxetine).

One patient died (suicide) during the study period and three died (bronchopneumonia, pulmonary edema and apoplexy) 12, 6 and 11 days, respectively, after the end of the treatment period. All deaths were on imipramine. In addition, 12 serious adverse events were reported. Two patients suffered from serious adverse events on reboxetine and 9 patients on imipramine, one of them suffering from two serious adverse events. On reboxetine, the two cases were: meningioma and acute confusional state and fall. On imipramine, 4 cases concerned cardiovascular disorders: postural hypotension, sudden

Pharmacia

Document 9550089

faint, atrial fibrillation and right bundle branch block and A-V block first degree; in all cases patients were affected by relevant cardiovascular disorders at anamnesis. The other cases concerned: 2 cases of fracture of the neck of the femur, one of them following from a fall; fall and fracture of the knee; a convulsive episode; drowsy and jerky movements in legs and urinary retention.

There was no indication of modifications in laboratory tests that were of clinical significance.

As for vital signs, major differences between reboxetine and imipramine were observed in the absolute frequency of clinically relevant decrease of diastolic blood pressure, higher on imipramine than on reboxetine on standing (22% and 13% of evaluated patients, respectively) and in the frequency of relevant increase of diastolic blood pressure, slightly higher in the reboxetine group on lying (13% and 7% of evaluated patients, respectively). The vast majority of relevant decreases and increases were reported once during the study.

The absolute frequency of heart rate, increased during treatment to values ≥ 100 beats/min, was slightly higher in the reboxetine than in the imipramine group and the maximal difference was observed on standing (12% and 6% of evaluated patients, respectively). However, the majority of these relevant increases occurred occasionally (reported once).

As for ECG recordings, newly emerged abnormalities were related to rhythm disorders (11.7% and 6.4% of the patients with normal tracings for this disorder at baseline in the reboxetine and imipramine groups, respectively), conduction disorders (6.0% and 3.9%, respectively), ischemic signs (4.3% and 3.0%, respectively) or other disorders (2.2% of the patients in the reboxetine group). However, in all cases, the proportion of patients with newly emerged abnormalities was consistently lower than the proportion of normalised cases.

9. DISCUSSION

Three hundred and forty-seven elderly patients suffering from Depressive Disorders entered the study, 176 patients received reboxetine, and 171 imipramine. Of the 347 patients, 218 (109 reboxetine, 109 imipramine) were randomised to the MDD stratum and 129 (67 reboxetine, 62 imipramine) to the DYS stratum. A total of 253 patients (72.9%) completed the study and 94 (27.1%) withdrew, 49 (27.8%) of the reboxetine group patients and 45 (26.3%) of the imipramine group patients, respectively. In the MDD subpopulation the proportion of patients withdrawing was slightly higher in the imipramine group (35.8%) than in the reboxetine group (30.3%). In the DYS subpopulation the proportion of withdrawing was higher in the reboxetine group (23.9%) than in the imipramine group (9.7%). Newly emerged adverse events or intercurrent illnesses were the main reason for discontinuation in 20 (11.4%) of the reboxetine and 27 (15.8%) of the imipramine patients. In the MDD subgroup these proportions were 12.8% (reboxetine) and 19.3% (imipramine) and in the DYS subgroup they were 9.0% (reboxetine) and 9.7% (imipramine).

The mean HAMD total score was reduced from 26.6 at Day 0 to 14.8 at last assessment in the 172 patients treated with reboxetine who had at least one assessment in addition to the baseline and to 11.4 at Day 56 in the 127 patients who completed the study. In the 168 patients who were treated with imipramine with at least one assessment in addition to baseline the mean HAMD total score was reduced from 26.1 at Day 0 to 12.9 at last assessment and to 8.8 at Day 56 in the 126 patients who completed the study. The difference between the two treatments in the mean HAMD decrease, at last assessment, was not clinically relevant (-1.5 points; 95% CI, -3.6 ÷ 0.6 points). However, in the DYS subpopulation, the difference between the two treatments in the mean HAMD decrease was clearly in favour of imipramine, being of -3.4 points (95% CI, -6.5 ÷ -0.2 points).

At last assessment, 54.1% of the reboxetine-treated patients and 56.5% of the imipramine-treated patients were classified as responders, while 42.4% and 49.4%, respectively, were seen to be in remission. A similar pattern of response and remission rate was observed in the MDD subpopulation, whilst there was a higher proportion of patients classified as responders and in remission on imipramine than on reboxetine in the DYS subpopulation.

At last assessment, on the whole population, the percentage of patients who were 'much to very much improved' (CGI - Global Improvement) was similar in both groups (56.9% in the reboxetine group and 59.4% in the imipramine group) and the between treatment difference was -2.5% (95% CI, -12.9% ÷ 7.9%). In the MDD subgroup, the proportion of 'much to very much improved' patients at last assessment was slightly higher on reboxetine than on imipramine (58.9% vs 52.3%) and the between treatment difference was 6.6% (95% CI, -6.0% ÷ 19.8%). On the contrary, in the DYS subpopulation, the proportion of 'much to very much improved' patients was in favour of imipramine

(72.1% vs 53.7% on reboxetine) being the between treatment difference -18.4% (95% CI, -34.8% ÷ -2.0%). Similarly, the proportion of cases with moderate to marked efficacy in absence of side-effects (CGI - Efficacy Index: 3 to 4) was slightly higher on reboxetine (40.2%) than on imipramine (34.9%) in the MDD subpopulation, while in the DYS subgroup this condition was reported in 52.5% of the patients on imipramine vs 38.8% of those on reboxetine.

The mean total MADRS score was reduced from 29.7 at Day 0 to 15.5 at last assessment in the 171 reboxetine group patients who had at least one assessment in addition to baseline, and to 11.7 in the 128 patients who had the assessment at Day 56. In patients treated with imipramine, values changed from 30.0 at Day 0 to 14.0 at last assessment (168 patients), and to 8.9 at Day 56 (126 assessed patients). Also for this rating scale a slightly higher reduction of the total score was observed on imipramine (from 27.9 to 9.8) than on reboxetine (from 28.0 to 14.6) in the DYS subpopulation.

The mean total GDS score was reduced from 23.1 at Day 0 to 14.0 at last assessment in the 172 reboxetine group patients with at least one assessment in addition to baseline, and to 11.4 in the 128 reboxetine patients who had the assessment at Day 56. In patients treated with imipramine, values changed from 23.4 at Day 0 to 12.9 at last assessment (168 patients), and to 9.2 at Day 56 (125 assessed patients). As above, in the DYS subpopulation the reduction of the total score at last assessment was slightly higher on imipramine (from 22.9 to 9.9) than on reboxetine (from 23.0 to 13.6).

In conclusion, therefore, while the results of the global analysis of efficacy assessments could not evidenciate differences of any relevance between the two treatments in terms of outcome, the results of the additional analyses on the MDD and DYS subpopulations indicate that both treatments were similarly effective in terms of improvement of the clinical picture in patients diagnosed as having a Major Depressive Episode/Disorder, while in dysthymic patients imipramine resulted more effective than reboxetine in terms of frequency and extent of improvement.

The analysis of the 17 specific items of the HAMD scale reported at baseline in the remission and non remission cases, showed that, as expected, the proportion of patients eventually in remission was higher among the less severe cases at baseline for the vast majority of items. For few items, however, the frequency of patients eventually in remission among severely ill patients (maximum score level) at baseline was particularly low in both treatment groups. This was the case for Insomnia Middle and Agitation and, mainly in the reboxetine group, for Hypochondriasis. In all cases, the prevalence of severely ill patients at baseline was higher in the reboxetine than in the imipramine group. These results are consistently present in the two subpopulations. However, extreme differences are apparent in the DYS subgroup of patients either in both treatment groups for Insomnia Middle and Agitation or, mainly in reboxetine group, for Hypochondriasis (5% of the severe patients at baseline eventually in remission vs 95% not in remission). In this latter case, severely ill patients at baseline were twice as frequent in the reboxetine

group (28.4%) than in the imipramine group (14.5%). These findings suggest that imbalances in the severity of the two treatment groups at baseline for few dimensions of the psychopathology, mainly related to the somatic component, more than a diagnostic specificity could explain the differences observed in the two subpopulations. In fact, a diagnostic specificity could hardly be taken into consideration in view of the known heterogeneity of the disorders subsumed in the DSM-III-R classification of Dysthymia [29].

All 347 patients who received study treatment were included in the safety analysis. The occurrence of newly reported adverse events was similar in both groups during the study; 120/176 (68.2%) reboxetine group patients reported 307 adverse events compared with 122/171 (71.3%) imipramine patients who reported 338 adverse events; however, the prevalence of adverse events was higher in the imipramine group than in the reboxetine group, with this difference being more evident in the MDD subpopulation. In the DYS subgroup, the prevalence of adverse events was higher in the reboxetine group than in the imipramine group during the initial 4 weeks of treatment. Discontinuation due to a newly emerged adverse event was more frequent on imipramine (15.8%) than on reboxetine (11.4%), mainly occurring in the MDD subgroup of patients (19.3% imipramine; 12.8% reboxetine).

The relative chance of developing at least one adverse event was not different in the two treatment groups [OR = 0.86 (95% CI, 0.55 ÷ 1.36)]; however, in the MDD subgroup of patients, the frequency of patients complaining of at least one adverse event was slightly higher in the imipramine than in the reboxetine group [OR = 0.70 (95% CI, 0.39 ÷ 1.26)], whilst in the DYS subgroup the frequency was slightly higher in reboxetine group [OR = 1.20 (95% CI, 0.57 ÷ 2.55)]. On the whole, the frequency of the events often reported under antidepressant medication was very similar in the reboxetine and imipramine groups, with only hypotension and related symptoms showing a cumulative risk of development significantly higher on imipramine than on reboxetine. This latter result was confirmed in the MDD subpopulation and not in the DYS subgroup.

In view of the small size of the Dysthymia sample (67 and 62 patients on reboxetine and imipramine), and of the contrasting results of other studies where both MDD and DYS non-elderly [30] or elderly [31] patients were included, not confirming a different frequency of adverse events on reboxetine in the two diagnostic subpopulations, any conclusion about a possible different proneness to adverse events on reboxetine of the two diagnostic subgroups seems hardly proposable. On the contrary, the greater prevalence in the reboxetine group of severely ill patients for few dimensions of the psychopathology, mainly related to the somatic component, as discussed above, should be considered in the interpretation of the findings.

In patients with or without cardiovascular disorders at admission, the frequency of cardiovascular adverse events was higher on imipramine than on reboxetine. However,

while on reboxetine the presence of cardiovascular disorders at baseline seemed not to facilitate the emergence of cardiovascular adverse events, in particular of hypotension and related symptoms, patients on imipramine suffered from newly emerged cardiovascular adverse events and, in particular, of hypotension and related symptoms, more frequently when affected by cardiovascular disorders at baseline (26% and 21%, respectively) than when not affected (17% and 12%, respectively). The differences in favour of reboxetine are mainly evident in the former population (12% vs 26% for cardiovascular adverse events and 5% vs 21% for hypotension and related symptoms).

Moderate or severe adverse events were more frequent on imipramine than on reboxetine (73% vs 65%). Males and females suffered from adverse events with similar frequency on reboxetine and on imipramine. The most relevant between-gender differences were related to the frequency of dry mouth, complained of mainly by female patients on reboxetine, increased sweating, complained of mainly by female patients in both treatment groups, hypotension and related symptoms and urinary hesitancy/retention, complained of mainly by male patients particularly on imipramine but also on reboxetine. The proportion of patients complaining of at least one adverse event with probable to definite relationship was higher on imipramine (43%) than on reboxetine (33%).

One patient died (suicide) during the study period and 3 further patients died few days after the end of the study (bronchopneumonia, pulmonary edema and apoplexy). All deaths were on imipramine. In addition, 12 serious adverse events were reported, 2 on reboxetine (meningioma, acute confusional state and fall) and 10 on imipramine (postural hypotension, sudden faint, atrial fibrillation, right bundle branch block and A-V block first degree, 2 cases of fracture of the neck of the femur, fall and fracture of the knee, convulsive episode, drowsy and jerky movements in legs and urinary retention).

There was no indication of modifications in laboratory tests that were of clinical significance. As for vital signs, major differences between reboxetine and imipramine were observed in the absolute frequency of clinically relevant decrease of diastolic blood pressure, higher on imipramine than on reboxetine on standing (22% and 13% of evaluated patients, respectively) and in the frequency of relevant increase of diastolic blood pressure, slightly higher in the reboxetine group on lying (13% and 7% of evaluated patients, respectively). The vast majority of relevant decreases and increases were reported once during the study. Lying and standing heart rate increased during treatment to values ≥ 100 beats/min in a slightly higher proportion of patients on reboxetine than on imipramine particularly on standing (12% vs 6%). However, the majority of these relevant increases occurred occasionally (reported once).

Newly emerged abnormalities in ECG recordings were mainly related to rhythm disorders (12% and 6% of patients with normal tracing for this disorder at baseline in reboxetine and imipramine group, respectively) and conduction disorders (6% and 4%, respectively).

10. CONCLUSION

The efficacy of reboxetine therapy in elderly patients suffering from Depressive Disorders, as evaluated by the improvement of HAMD, CGI, MADRS and GDS scales, appeared not different to that of imipramine. This was particularly the case in the MDD subpopulation, while in the DYS subgroup imipramine was slightly more effective than reboxetine. This finding could be connected with imbalances between the two treatment groups at baseline for the somatic component of the psychopathology, more severe in the reboxetine group, rather than with a diagnostic specificity. The overall tolerability of reboxetine was highly acceptable, as shown in the minimal modification of vital signs, haematology and blood chemistry tests, and ECG examinations. The overall frequency of adverse events was similar on reboxetine and imipramine, thus not allowing the rejection of the hypothesis of equal tolerability of reboxetine and imipramine as stated in the study protocol. However, the frequency of moderate to severe adverse events and of serious adverse events, the prevalence of adverse events during the treatment period and the discontinuation rate in view of adverse events was higher on imipramine than on reboxetine. In addition, the rate of occurrence of cardiovascular disorders, in particular hypotension and related symptoms, was significantly lower on reboxetine than on imipramine.

1.0 Protocol Summary

The study will be carried out in order to evaluate the tolerability and activity of reboxetine, a new potential antidepressant agent, in elderly depressed patients. After an initial washout period, 300 patients over 65 years suffering from depressive disorders will receive either reboxetine in repeated doses of 4 to 6 mg/day or imipramine 75 to 100 mg/day for the period of 8 weeks. Responders will then enter a follow-up treatment on a long-term basis. The effectiveness will be measured by use of rating scales (HAMD, MADRS, GDS, CGI). Tolerability will be evaluated on the basis of the appearance of newly observed signs/symptoms, vital signs, laboratory tests and ECG.

2.0 Introduction

Reboxetine (FCE 20124 or RS, RS 2-[α -(2-ethoxy-phenoxy) benzyl] morpholine methanesulphonate) is a chemically new compound highly potent in pharmacological and biochemical tests predictive of antidepressant effectiveness: reserpine antagonism, norepinephrine reuptake inhibition, REM sleep latency increase. In addition reboxetine has been found to be able to prevent clonidine effects in rodents after single oral administration, in contrast with what is observed following tricyclic monoamine uptake inhibitors, which were found to be active only upon repeated doses: these results indicate that the compound is able to decrease the sensitivity of α_2 noradrenergic receptors, one of the biochemical correlates of chronic antidepressant treatment, after single oral dose; therefore it may be expected to exert antidepressant effectiveness of faster onset with respect to available antidepressants in patients (1).

In phase I studies healthy volunteers were orally administered single doses of 0.5 - 5 mg of the compound (2,3). After 5 mg orthostatic hypotension, accompanied by tachycardia and by subjective symptomatology consistent with the disturbed circulatory regulation was observed.

In these studies single doses of 1 & 3 mg of the compound showed dose-dependent CNS effects with EEG modifications (decreased power of theta and fast-beta waves in the fronto-central derivate), performance improvement (peg-board test) and growth hormone increase, the latter reportedly sensitive to hypothalamic noradrenergic stimulation by norepinephrine reuptake inhibitors.

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

Comparison with the positive control, imipramine 75mg, indicated that reboxetine does not possess the marked sedative activity of imipramine but rather psychostimulating properties. This is based on the evidence that imipramine demonstrates similar EEG modifications in the fronto-central derivative, modifications indicative of sedative activity in the occipito-temporal derivative as well as the deterioration of the Pauli performance test, in the absence of growth hormone modifications. After all treatment standing heart rate increase and salivation decrease was apparent. No other modifications of tolerability parameters were observed.

The pharmacokinetics of the compound were evaluated in the above mentioned studies as well as after administration of 2 mg ¹⁴C-FCE 20124 to 3 healthy volunteers (4). Most of the radioactivity circulating in plasma (73% in terms of AUC) was accounted for by unchanged reboxetine; the average peak levels were observed at 2 hours, with remarkably stable levels 1-6 hours after administration; its plasma half-life was estimated as 13.2 h, slightly lower than that of total radioactivity.

Antidepressant efficacy of reboxetine has been demonstrated in a controlled study in Major Depressive Disorders carried out vs desipramine and placebo. Frequency of response (50% decrease of Hamilton Depression Rating Scale, study end point) was significantly higher in the reboxetine (60%) than in the placebo (35%) group. As to the time course of the response, significant differences vs placebo in the average values of the rating scales applied were observed from day 10-14 of the treatment in the reboxetine group and from day 14-21 in the desipramine group. The overall superiority of reboxetine over desipramine in the administered dose range reached statistical significance for one of the rating scales at the end of treatment, confirming the trend seen in the other scales.

As far as signs/symptoms are concerned, dry mouth and blurred vision were reported less frequently in patients treated with reboxetine than imipramine. On the other hand urinary hesitancy was significantly more frequent in reboxetine group. Noteworthy trends included greater frequency of headache in patients treated with reboxetine, of constipation in both the desipramine and reboxetine group and of tachycardia in desipramine treated patients.

9550089

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

3.0 Rationale

Phase II results obtained in controlled conditions in adult patients suffering from Major Depressive Disorders indicate that reboxetine is an effective antidepressant agent. A dose-finding study in 12 elderly depressed patients showed overall good tolerability of reboxetine in the dose range of 4 to 8 mg. Only 3 out of 12 patients did not reach the maximum dose of 8 mg because of slight to moderate side effects (report in preparation). The tolerability and activity of the compound in the elderly need now to be tested in controlled conditions vs a reference antidepressant. Since phase II evidence on antidepressant efficacy of the compound is expected to apply also to the elderly, the analysis will focus on the comparative evaluation of the tolerability of two agents. Stratification for the diagnosis of Major Depressive Episode and Dysthymia will be undertaken.

4.0 Objective

The study will be carried out in order to evaluate the tolerability and efficacy of reboxetine in elderly patients suffering from depressive disorders.

5.0 Design

5.1 Description

This Phase III study will be carried out on a multi-center, multinational basis according to a double blind parallel group design, controlled vs imipramine with random allocation of patients to one of the two treatments.

5.2 Number of Subjects Proposed

Each center will recruit enough patients to collect a total sample of 300 patients fulfilling the criteria for entering the study.

5.3 Logistics

The centers participating in the study are listed in enclosure 1.

6.0 Study Population

6.1 Source of Subjects

Depressed patients in acceptable physical conditions hospitalized following the onset of depressive episode

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

or attending the out-patients clinics of the participating centers.

6.2 Inclusion Criteria

- Patients aged over 65 years
- Fulfilment of the DSM-III-R criteria for Major Depressive Episode or Dysthymia (enclosure 2)
- Total score of 18 or more in the 21-HAMD (enclosure 3) at screen
- Total score of 22 or more in the MMS (enclosure 4)
- Informed consent (see 15.2, proposed form - enclosure 5)

6.3 Exclusion Criteria

- Resistance to antidepressant treatment (lack of response to at least two courses of previous antidepressants given at full doses for more than 1 month).
- Clinically relevant abnormal findings in the physical examination and/or laboratory tests at admission (see Safety Assessments).
- History of Major Depressive Episodes associated with endocrine disorders: hypo and hyper-thyroidism tested by TSH and T4 in thyroid drug-free conditions at screen and defined as at least 10% abnormal values of the laboratory norms; adrenal insufficiency, etc.
- Past history of any drug hypersensitivity.
- History or presence of gastrointestinal disease likely to cause impairment of gastrointestinal absorption, liver disease (hepatic insufficiency defined as clinically relevant abnormal findings of following tests: hemolytic markers - SGOT and SGPT; cholestasis markers - total bilirubin, gamma-GT, alkaline phosphatase; mesenchymal activations markers - serum protein electrophoresis) or kidney disease (renal insufficiency defined as moderate to medium renal impairment with creatinine clearance not lower than 30 ml.min⁻¹) or other conditions known to interfere with the absorption, distribution, metabolism and excretion of drugs.
- Participation in any clinical study with an investigational compound in the 4 weeks preceding the study

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

8.2 Labelling

The experimental treatments will be contained in glass amber bottles labelled with the indication of the N° of subject and the treatment week (enclosure 6).

8.3 Packaging

Eighteen glass amber bottles (nine for the "morning" and nine for the "evening") labelled with the patient's number and the indication day 1-3, day 4 -7, week 2, week 3, week 4 ... week 8 will be prepared for each patient. For the first week two "morning" and two "evening" bottles will be prepared: 1 bottle will contain medication for days 1-3, i.e. 4 tablets (3 tablets + 1 tablet for possible losses), and 1 bottle will contain medication for days 4 -7, i.e. 5 tablets (4 tablets + 1).

Each "morning" and "evening" bottle for the treatment from week 2 to week 8 will contain the medication necessary for 7 days of treatment, i.e. 8 tablets (7 tablets plus 1 tablet for possible losses). In addition for each patient a carton labelled with the patient number and the indication "week 4 - dose 2" to "week 8 - dose 2" will be provided for the possible dosage increase during the treatment period starting from 4th week.

8.4 Drug Supplies Storage

Drug supplies will be stored at room temperature. All drug supplies will be handled under the direct responsibility of the Investigator and held by the hospital pharmacy.

The Study Monitor will check drug storage conditions during monitoring visits. The Investigator will be also responsible for drug accountability and will keep a record of the test compounds received from the Sponsor as well as of the dispensed drug.

8.5 Dispensing, Use and Disposal of the Preparation during and at the End of the Study

Medication will be dispensed to the patient on the occasion of each visit; the Investigator will detach the upper label from each of the weekly bottles and will attach them in the appropriate space in the Case Record Form. Used bottles will be returned to the study Monitor during site visits. All unused medication will be returned to Farmitalia Carlo Erba at the end of the study.

9550089

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9.0 Study Conduct

9.1 Pre-treatment Period

Patients will be checked for eligibility according to the inclusion and exclusion criteria. No washout will be needed in drug-free patients. A washout period will be required for patients stopping other medication before entry in the study. This period will last 4 days in the case of previous non-psychotropic medication, 7 days in the case of previous psychotropic medication including reversible MAO inhibitors, 14 days in the case of previous MAOI administration and 3 - 4 weeks in the case of previous fluoxetine therapy. During this period the only permissible psychotropic medication will be sleep inducer p.r.n. A shortacting benzodiazepine (see 9.6), alternatively chloral hydrate or chlormethiazole, as sleep inducer can be used.

Informed consent will be obtained (see 15.2). Eligible patients will be randomized to one of two treatment groups and will then undergo baseline assessments.

Information on patients screened for the study, including those not eligible, will be collected in the Screening Form - enclosure 7.

9.2 Treatment Schedule

Patients will receive 2 capsules of reboxetine or imipramine (one in the morning and one in the evening). Treatment will be taken at least 2 hours before or after meals.

In the case of lack of effect or unsatisfactory response (no change or minimal improvement at the CGI - see assessments) but of good tolerance, after 3 weeks of treatment the dose can be increased up to 6 mg of reboxetine or 100 mg of imipramine. In the case of intolerance the dose will be reduced to the previously well tolerated dosage level.

The daily dose can be reduced by half (only the morning dose will be administered) in the case of emergence of non tolerable signs or symptoms. Interruption of treatment for more than two consecutive days will not be allowed. Such patients will be defined as non compliant with the treatment.

9.3 Duration of Treatment

Treatment will be administered for eight weeks.

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

9.4 Indications for Early Termination of Therapy

Termination of test therapy prior to completion of the treatment period may be considered under the following circumstances:

- Patient's request
- Unacceptable toxicity: this is defined as the occurrence of serious and/or unexpected (see Adverse Events) adverse events or the persistence of non tolerable signs or symptoms which are not alleviated by reducing the dose to the lower dosage level
- Lack of efficacy during the treatment: this will apply to patients who after completion of at least 3 weeks of treatment show worsening of the global clinical picture (CGI - Global Improvement, see assessments)
- Switch to mania

If treatment is discontinued the final complete battery of assessments will be carried out.

9.5 Dropouts/Replacement of Subjects

Patients who drop out of the study for any reason during treatment will not be substituted. For those patients who have been selected for the study who drop out at any time, even before the entrance to the treatment period, documentation will be provided.

9.6 Concomitant Therapy

Only drugs considered essential will be allowed. These should be stable for at least one month before admission to the study. Drugs that may interfere with the pharmacokinetics/pharmacodynamics of reboxetine will be stopped for a period at least 5 times their elimination half-life before the study start.

In particular the following drugs should not be used during the trial: neuroleptics, antidepressants, psychostimulants, tranquilizers (with the exception of sleep medication, see below), antiparkinson and anticholinergic agents, sympathomimetic drugs, hormones including L-thyroxine (with the exception of hormonal therapy of the degenerative diseases) and anesthetic agents.

During the course of the study non psychotropic medication which is considered necessary for the

FARMITALIA CARLO ERBA
ERBACONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

patient's welfare may be administered. The drugs, dosage, reason and frequency of administration will be recorded on the CRF. A shortacting benzodiazepine, alternatively chloral hydrate or chlormethiazole, as a sleep inducer p.r.n. at bed-time will be allowed.

9.7 Indications for opening the code

The Investigator will be given individual sealed envelopes containing the information on each patient's treatment. These latter may be opened only in case of emergency necessitating treatment identification; the Investigator will immediately (within 24 hours) inform the study Monitor (enclosure 13) or FICE Milan (see address on cover page) and will report full description of reasons for opening the code in the CRF (Adverse Event Form).

9.8 Follow-up

A follow-up visit will be carried out for each patient one month after treatment discontinuation in order to monitor possible withdrawal reactions and collect information on possible adverse events.

Patients willing to continue receiving the experimental treatment after completion of the 8 week treatment period, and having demonstrated very good or good improvement (CGI) at the end of the 8th week vs day 0, will be maintained under the experimental treatment on a long-term basis in double-blind conditions up to completion of the 2 months experimental treatment in the last patient of the study. Afterwards patients may continue the treatment in open conditions with reboxetine or imipramine respectively.

9.9 Study Timetable

Foreseen start date:	July 1992
Duration of accrual:	12 months
Foreseen end date:	July 1993

10.0 Efficacy Assessments

10.1 Variables to be Measured for Efficacy Assessment

On days 0, 7, 14, 21, 28, 35, 42, 49 and 56 the following scales will be applied:

- 21-items Hamilton Depression Rating Scale /HAMD/ (7), see enclosure 3
- Montgomery-Asberg Depression Rating Scale /MADRS/ (8), see enclosure 15

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

- Geriatric Depression Rating Scale /GDS/ (9), see enclosure 16
- Clinical Global Impression /CGI/ (10), see enclosure 8

All psychiatric evaluations and ratings will be carried out by the same observer for a given patient.

10.2 Efficacy Definition

An improvement of clinical picture scored as "1" (very much improved) or "2" (much improved) on the Clinical Global Impression - Global Improvement vs day 0 will be considered to be a response.

10.3 Criteria for Efficacy Evaluability

Every randomized patient will be included in the analysis.

11.0 Safety Assessment

11.1 Variables to be Measured for Safety Assessment

- Standard medical history: pre-treatment screen
- Standard clinical examination: full physical examination; chest X-ray or pulmonary function test (optional): screen
- Blood pressure and pulse will be measured in the lying position (after 5 minutes lying) and in the standing position (1-2 minutes after standing up) in the morning: at each weekly visit
- ECG: at screen, day 28 and at the end of treatment
- At screen: TSH, T4 and creatinine clearance. Alternatively creatinine clearance can be calculated according to the formula:
$$\frac{(140 - \text{age}) \times \text{body weight (kg)}}{72 \times \text{serum creatinine (mg/ml)}} \quad (\text{male})$$

$$\frac{(140 - \text{age}) \times \text{body weight (kg)}}{85 \times \text{serum creatinine (mg/ml)}} \quad (\text{female})$$
- laboratory tests (full blood count, ESR, serum electrolytes, liver enzymes, blood sugar, BUN, serum creatinine, uric acid, total bilirubin, total serum proteins and electrophoresis, serum cholesterol and triglycerides, urine analysis): at screen, day 28 and at the end of treatment

FARMITALIA CARLO ERBA
ERBAMONT GROUP
MEDICAL DEVELOPMENT, CNS

9550089

-
- Adverse events: a check list will be administered at each visit (see enclosure 9).

11.2 Criteria for Safety Evaluability

Every patient who has received at least one dose of the experimental treatment will be included in the safety evaluation.

12.0 Adverse Events

Patients will be notified of possible adverse events they could experience and instructed to immediately report them to the Investigator.

12.1 Definitions

"Serious": Any event that suggests a significant hazard, contraindication, side effect or precaution, including any one of the following:

- fatal or life-threatening;
- disabling or incapacitating;
- requiring or prolonging hospitalization;
- congenital anomaly;
- cancer;
- overdose.

For a list of examples of "serious" adverse events reported to U.K. CSM, see Br. J. Clin. Pharmacol. 26: 679-688, 1988.

"Unexpected": Any adverse event that is not identified in nature, severity or frequency in the current investigator brochure because it has not been previously reported in association with the given investigational drug or, if previously reported, its frequency has not yet been adequately characterized.

12.2 Information to be collected

The following information should be collected for every adverse event occurring in the study:

- study and patient identification;
- age, sex, race, weight;
- treatment and dose at time of adverse event;
- concomitant drugs;
- date of onset, if known, or clinic visit at which the event was discovered;
- duration of treatment at time of adverse event (or date of treatment start);
- description of the adverse event (verbatim, using the original term used by the Investigator);

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

-
- duration of the adverse event;
 - severity (e.g. mild, moderate, severe);
 - action taken (none, change in dose, treatment interrupted or stopped, etc.);
 - outcome (recovered with no residual effect, persistent but no treatment, persistent and being treated, residual effect being treated, residual effect with no treatment, death);
 - dechallenge (did the AE disappear after treatment withdrawal or dose reduction?)
 - rechallenge (did the AE reappear on resuming treatment?)
 - investigator's evaluation of causal relationship between treatment and AE.

The Karch and Lasagna modified criteria (enclosure 11) will serve as guidelines for definition of drug cause-effect relationship.

The same information should be collected for any serious AE occurring within one month of the last dosing or during follow-up. In the case of death on study or within one month after the last dosing, the following additional information is needed:

- cause of death;
- other significant conditions contributing to death, but not related to the causes given above;
- autopsy findings (when applicable)

The same information should be collected if death occurs later but is the final outcome of an event which started within the indicated time frame.

12.3 Procedure of report

Any adverse event, noticed by the Investigator or complained of by the patient, including clinically relevant lab abnormalities, will be recorded in the appropriate section of the CRF, regardless of presumed relationship to study medication.

In addition, any serious (expected or unexpected) adverse event should also be reported separately, as promptly as possible (within 24 hours) to the study monitor and by filling in an Adverse Event Report Form (enclosure 10).

Any fatal or life-threatening event should be reported immediately by the Investigator by phone or fax to the local study monitor. Farmitalia Carlo Erba will notify the regulatory authorities in accordance with statutory requirements.

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

13.0 Evaluation Schedule

Is reported in table 1.

14.0 Statistical Considerations

14.1 Sample size

The main aim of the study is to compare the safety of the two compound, reboxetine and imipramine, the former being expected as better tolerated. In order to test this hypothesis the ratio between the number of patients experiencing at least one adverse events, mild through severe, whichever the nature, during the study period out of the total number of randomized patients will be taken as the principal end-point of the study.

Previous studies with imipramine estimated a rate of adverse events, mild to severe, as high as 60%. The rate of events of the same severity under reboxetine is expected to be no higher than 40%.

Additionally, since ethical reasons suggest to stop the trial in this type of population as soon as a conclusion of inferiority of one of the two treatments is reached, one interim analysis according to O'Brian Fleming group sequential method is planned.

Therefore in order to prove with a power of 90% the hypothesis of a better tolerability of reboxetine, according to the above mentioned O'Brian Fleming plan, 67 patients per arm for each of the two sequentially tested groups are required. The procedure will ensure an overall two tailed- α -level of 0.05 and the significance test will be carried out at a level 0.015 at the first stage and 0.042 at the second stage.

14.2 Statistical Analysis

The analysis of the main end-point of the study will be carried out by Mantel-Haenszel test using center as stratification factor. Adverse events will be also described in terms of severity, relationship with the treatments and time of onset. Body system classification of events will be included.

For all the laboratory examination and within each of the two treatments the following analysis will be provided:

- Frequency and percentage of patients whose values are below, within or above the normal range at each

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

visit. Either Mc Nemar test or Stuart-Maxwell test will be adopted for testing if the distribution across the categories at baseline differs from the distribution at each visit.

- Frequency and percentage of patients whose values are lower, equal or higher than their baseline values. Two tails sign test will be adopted for testing the hypothesis of equality of the proportion of lower values and higher values against the alternative hypothesis of difference in either the directions. Comparison with baseline and each visit will be provided.
- Means of difference between baseline and each visit assessment will be tested by either two-tails paired t-test or signed-rank test depending on the distribution of the variable. Standardisation across different laboratories ranges will be provided in order to make difference comparable.

Vital signs will be summarised by descriptive statistics, broken down by treatment.

Efficacy variables, as Hamilton total score, Clinical Global Impression score, Efficacy index score, considered as secondary end-points of this study will be submitted to parametric or non parametric explorative analysis, such as analysis of covariance, Wilcoxon test. Ninety-five percent confidence interval of the differences of means of continuous variables after 4 and 8 weeks of treatment will be also provided.

15.0 Ethical Aspects

The study will be carried out according to the Helsinki Declaration (Hong-Kong revisions, enclosure 12).

15.1 Ethical Committee

This study will not be undertaken until approval is obtained from the Ethical Committee of each participating center. It is responsibility of the Investigator to submit the study protocol with its attachments to the Committee.

The Investigator is committed, in compliance with local requirements, to inform the Committee of any emergent problems, serious adverse reactions or protocol amendments.

15.2 Informed Consent

Before entering the study each patient will receive the information about the nature, duration and purpose of

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

the study and the action of the compound explained in such a manner that the patient is aware of the potential risks, inconveniences or adverse effects that may occur and can express his/her informed consent to participation.

The consent form (proposed form - enclosure 5) will be signed by the patient or by the next of kin and by the Investigator. In the latter case, the signature of a witness will testify that full information has been given to the patient.

16.0 Protocol Amendments

After the protocol has been signed, no changes will be made without the agreement of both the Investigator and the Sponsor. Any change will be recorded on a written agreement which will be signed and dated by both parties and attached to the original protocol. Where required by local laws regulatory approval will be obtained before implementing any protocol amendment.

17.0 Study Monitoring

The Monitors for the study are listed in enclosure 13. A prestudy visit will be made by the Monitor to the Investigator in order to discuss problems, if any, and the obligations of both the Sponsor and the Investigator. During the trial monitoring visits will be paid to the site by the study Monitor monthly.

The trial may also be monitored by the Sponsor's Quality Assurance Department. During visits the Monitor will assess the progress of the study, review compliance with the study protocol, discuss any problem, check the CRFs for legibility, accuracy and completeness, assess the status of drug storage dispensing and retrieval.

18.0 Supply and Inventory

Test preparations will be supplied by Farmitalia Carlo Erba in the form described in 6.1. Records will be kept by the Investigator as to the disposition of study drug for each patient. A disposition form accounting for all study supplies will be signed by the Investigator (enclosure 17).

19.0 Administrative Aspects

19.1 Insurance Policy

Farmitalia Carlo Erba Company declares to have a group insurance cover (policy N°481.440647.50 - Fondiaria Assicurazioni) which provides indemnity to the

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

Investigator, to the co-Investigators and to the subjects participating in the trial (enclosure 14). Where local law requires the investigator will be provided with the complementary police by the Subsidiary.

19.2 Curriculum Vitae

The Investigator will provide the Sponsor with signed copies of his/her and co-Investigators CVs.

19.3 Data Collection in the Case Record Form

All study data will be recorded in the CRF supplied by the Sponsor (Attachment B). A black ink ball point pen should be used for entering the data to ensure the good quality of the reproduced CRFs copies.

Only the Principal Investigator and the duly authorized co-Investigators can make entries in the CRF.

Corrections must be made by crossing out the incorrect entry (which must remain legible) and entering the correction followed by the Investigator's initials and the date of the correction.

During monitoring visits the Monitor will remove the original and one copy of each page, while the Investigator will retain a copy for his files. These copies together with the drug disposition records will be kept by the Investigator for fifteen years after the discontinuation of the investigation.

19.4 Use of the Information related to the Study

All unpublished documentation including the protocol, the CRF and the Investigator's Brochure, given to the Investigator is confidential. These documents cannot be disclosed to a third party without the written consent of FICE R&D. The submission of these documents to the Ethical Committee is expressly permitted.

The Investigator agrees that FICE R&D maintains the right to utilize the results of this study, in their original form and/or in a global report, for submission to the governmental and regulatory authorities of any country.

19.5 Statement of Investigator

The study will be carried out according to Good Clinical Practice (GCP). The Investigator agrees to comply with the GCP procedures by signing the statement (enclosure 18).

FARMITALIA CARLO ERBA
ERBAMONT GROUP
CLINICAL DEVELOPMENT, CNS

9550089

20.0 Study Report

20.1 Clinical Study Final Report

The final Medical Study Report will be written by the Product Leader and will be submitted to the Investigator for approval and signature.

20.2 Publication of Study Results

The results of the study will be published in a common publication, agreed upon between Investigator and FICE R&D.

The Investigator, whilst free to use the data resulting from this study for individual publications (subsequent to the common one), is asked to discuss any paper with Farmitalia Carlo Erba prior to submission; to this purpose a copy of manuscript/abstract has to be provided for FICE R&D Approval Procedure 30 days prior to publication.

21.0 End of the Study

Either the Investigator or FICE R&D could terminate this study at any time for well documented reasons. In this event the other party will be immediately notified.

DSM-III-R: DIAGNOSTIC CRITERIA FOR THE MAJOR DEPRESSIVE EPISODE

Note: all A, B, C and D must be marked as "present"

Mark "1" if present

A. At least five of the following symptoms have been present during the same two-week period and represent a change from previous functioning; at least one of the symptoms is either 1) depressed mood or 2) loss of interest or pleasure.

- 1) depressed mood most of the day, nearly every day, as indicated by subjective account or observation by others
- 2) markedly diminished interest or pleasure in all, or almost all, activities most of the day, nearly every day (as indicated either by subjective account or observation by others of apathy most of the time)
- 3) significant weight loss or weight gain when not dieting (e.g. more than 5% of body weight in a month), or decrease or increase in appetite nearly every day
- 4) insomnia or hypersomnia nearly every day
- 5) psychomotor agitation or retardation nearly every day (observable by others, not merely subjective feelings of restlessness or being slowed down)
- 6) fatigue or loss of energy nearly every day
- 7) feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick)
- 8) diminished ability to think or concentrate, or indecisiveness, nearly every day (either by subjective account or as observed by others)
- 9) recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide

"A" present.....

- B. 1) It cannot be established that an organic factor initiated and maintained the disturbance
- 2) The disturbance is not a normal reaction to the death of a loved one

"B" present.....

C. At no time during the disturbance have there been delusions or hallucinations for as long as two weeks in the absence of prominent mood symptoms (i.e., before the mood symptoms developed or after they have remitted)

"C" present.....

D. Not superimposed on Schizophrenia, Schizophreniform Disorder, Delusional Disorder, or Psychotic Disorder NOS.

"D" present.....

ENCLOSURE 5

REBOXETINE PROTOCOL 20124/035

Multicenter, multinational double blind study of the tolerability and activity of reboxetine vs imipramine in elderly patients with depressive disorders.

CONSENT FORM

Principal Investigator:

EXPLANATION

Purpose of the study

Reboxetine, a new potential antidepressant agent, has effects in animals which suggest that it may exert therapeutic efficacy of faster onset, in comparison with established antidepressant drugs, in patients suffering from depressive disorders. The trial is proposed in order to learn about the antidepressant effectiveness and the tolerability of the compound in elderly patients.

Plan of the study

After an initial drug free wash out period of 4 to 7 days, patients will receive reboxetine in the daily dose up to 8 mg, or imipramine in the daily dose up to 150 mg for eight weeks. Treatment will be discontinued in case of re-emerge of psychiatric symptomatology or in case of significant side-effects. In addition patients participating in the study can withdraw their consent at any time without prejudice to their continued medical treatment.

During treatment, physical and psychiatric examination will be done on frequent occasions, in order to determine possible side-effects and benefit of treatments. Blood tests, urinalysis, ECG will be undertaken at the entry to the study, after 4 weeks of treatment and at the end of the treatment. Blood pressure and pulse will be taken every week.

Possible discomforts and risks

Antidepressant drugs can cause dry mouth, blurred vision, dizziness, mild difficulty in voiding urine, postural hypotension and electrocardiographic changes.

Reboxetine has been so far administered for 28 days to about 180 patients and was well tolerated up to the dose of 5 mg twice daily. In the dose range of 3-5 mg twice daily clinically relevant improvement of depressive condition was present in the majority of patients; symptoms complained off by patients were mainly mild and transient and included most frequently headache, sweating, lassitude, nasal congestion, constipation and urinary hesitancy. At higher doses orthostatic hypotension, tachycardia, dizziness, blurred vision and nausea were reported.

Patients participating in the study will be carefully monitored to detect early signs of such side-effects.

Possible benefits

Other drugs are available for treatment of depressive disorders but none has been of proven value in all cases. This study will allow the evaluation of the antidepressant activity of reboxetine in comparison with imipramine, a compound of established efficacy.

Alternative treatment

Patients would receive alternative pharmacological therapy with an antidepressant drug chosen on the basis of response during previous episodes, if any. Risks and benefits of receiving treatment with any of the available antidepressant drugs can be explained by the Investigator.

Confidentiality

Participation in the study will be kept confidential to the extent permitted by law.

Problems and questions

Should any problem or question arise with regard to the study, patients can contact the Principal Investigator:

.....
or the other staff members also involved in the study:

.....

9550089

ENCLOSURE 5

In addition any problem or question can be discussed with a member of the Institutional Review Board, the Committee which has evaluated the potential risks and possible benefits of the study.

Payments and policy regarding research-related injuries.

Patients will not be paid for the participation in the study. The Clinical Center will provide short-term medical care for any physical injury resulting from participation in the study. No long-term medical care or financial compensations for such injuries will be provided except as it may be through whatever remedies are normally available under law. Insurance coverage is granted through the Sponsor Company.

PATIENT CONSENT

I have read the explanation about this study and I have been given the opportunity to discuss it and to ask questions. I hereby consent to take part in this study.

Patient's Signature

date

I have explained all the above indicated aspects of the study to the patient, who expressed his/her consent to the participation.

CLINICAL GLOBAL IMPRESSION (CGI)

A. SEVERITY OF ILLNESS

Considering your clinical experience with this particular population, how mentally ill is the patient at this time?

- 1 Normal, not at all ill
- 2 Borderline mentally ill
- 3 Mildly ill
- 4 Moderately ill
- 5 Markedly ill
- 6 Severely ill
- 7 Among the most extremely ill patients

B. GLOBAL IMPROVEMENT (rate total improvement whether or not, in your judgement, it is due entirely to drug treatment)

Compared to this condition at admission to the study, how much has he changed?

- 1 Very much improved
- 2 Much improved
- 3 Minimally improved
- 4 No change
- 5 Minimally worse
- 6 Much worse
- 7 Very much worse

C. EFFICACY INDEX (rate this item on the basis of drug effect only)

Activity	Tolerability: side effects			
	None	Do not significantly interfere with patient's functioning	Significantly interfere with patient's functioning	Outweigh therapeutic effect
MARKED Vast improvement, complete or nearly complete remission of all symptoms	1	2	3	4
MODERATE Decided improvement, partial remission of symptoms	5	6	7	8
MINIMAL Slight improvement which does not alter status of care of patient	9	10	11	12
UNCHANGED OR WORSE	13	14	15	16

ADVERSE DRUG REACTION - A CRITICAL REVIEW

CAUSE-EFFECT RELATIONSHIP

P.E.KARCH, L.LASAGNA
(JAMA Dec. 22, 1975-Vol.234)

1. DEFINITE (or CERTAIN)

A reaction that follows a reasonable temporal sequence from administration of the drug or in which the drug level has been established in body fluids or tissues; that follows a known response pattern to the suspected drug; and that is confirmed by improvement on stopping the drug (dechallenge), and reappearance of the reaction on repeated exposure (rechallenge).

2. PROBABLE

A reaction that follows a reasonable temporal sequence from administration of the drug; that follows a known response pattern to the suspected drug; that is confirmed by dechallenge; and that could not be reasonably explained by the known characteristics of the patient's clinical state.

3. POSSIBLE

A reaction that follows a reasonable temporal sequence from administration of the drug; that follows a known response pattern to the suspected drug; but that could have been produced by the patient's clinical state or other modes of therapy administered to the patient.

4. DOUBTFUL

Any reaction that does not meet the criteria above.

5. UNKNOWN

Relationship for which no evaluation can be made.

6. NOT RELATED

A reaction for which sufficient information exists to indicate that the aetiology is unrelated to the study drug.

Enclosure 12

Appendix 5
Declaration of Helsinki IV (Hong Kong - September 1989)

WORLD MEDICAL ASSOCIATION DECLARATION OF HELSINKI

Recommendations guiding physicians
in biomedical research involving human subjects

Adopted by the 18th World Medical Assembly,
Helsinki, Finland, June 1964,

and amended by the
29th World Medical Assembly,
Tokyo, Japan, October 1975,
35th World Medical Assembly,
Venice, Italy, October 1983
and the

41st World Medical Assembly
Hong Kong, September 1989

INTRODUCTION

It is the mission of the physician to safeguard the health of the people. His or her knowledge and conscience are dedicated to the fulfillment of this mission.

The Declaration of Geneva of the World Medical Association binds the physician with the words, "The health of my patient will be my first consideration," and the International Code of Medical Ethics declares that, "A physician shall act only in the patient's interest when providing medical care which might have the effect of weakening the physical and mental condition of the patient." The purpose of biomedical research involving human subjects must be to improve diagnostic, therapeutic and prophylactic procedures and the understanding of the aetiology and pathogenesis of disease.

In current medical practice most diagnostic, therapeutic or prophylactic procedures involve hazards. This applies especially to biomedical research.

Medical progress is based on research which ultimately must rest in part on experimentation involving human subjects.

In the field of biomedical research a fundamental distinction must be recognized between medical research in which the aim is essentially diagnostic or therapeutic for a patient, and medical research, the essential object of which is purely scientific and without implying direct diagnostic or therapeutic value to the person subjected to the research.

Special caution must be exercised in the conduct of research which may affect the environment and the welfare of animals used for research must be respected.

Because it is essential that the results of laboratory experiments be applied to human beings to further scientific knowledge and to help suffering humanity, the World Medical Association has prepared the following recommendations as a guide to every physician in biomedical research involving human subjects. They should be kept under review in the future. It must be stressed that the standards as drafted are only a guide to physicians all over the world. Physicians are not relieved from criminal, civil and ethical responsibilities under the laws of their own countries.

I. BASIC PRINCIPLES

1. Biomedical research involving human subjects must conform to generally accepted scientific principles and should be based on adequately performed laboratory and animal experimentation and on a thorough knowledge of the scientific literature.
2. The design and performance of each experimental procedure involving human subjects should be clearly formulated in an experimental protocol which should be transmitted for consideration, comment and guidance to a specially appointed committee independent of the investigator and the sponsor provided that this independent committee is in conformity with the laws and regulations of the country in which the research experiment is performed.
3. Biomedical research involving human subjects should be conducted only by scientifically qualified persons and under the supervision of a clinically competent medical person. The responsibility for the human subject must always rest with a medically qualified person and never rest on the subject of the research, even though the subject has given his or her consent.
4. Biomedical research involving human subjects cannot legitimately be carried out unless the importance of the objective is in proportion to the inherent risk to the subject.
5. Every biomedical research project involving human subjects should be preceded by careful assessment of predictable risks in comparison with foreseeable benefits to the subject or to others. Concern for the interests of the subject must always prevail over the interests of science and society.
6. The right of the research subject to safeguard his or her integrity must always be respected. Every precaution should be taken to respect the privacy of the subject and to minimize the impact of the study on the subject's physical and mental integrity and on the personality of the subject.
7. Physicians should abstain from engaging in research projects involving human subject unless they are satisfied that the hazard involved are believed to be predictable. Physicians should cease any investigation if the hazards are found to outweigh the potential benefits.
8. In publication of the results of his or her research, the physician is obliged to preserve the accuracy of the results. Reports of experimentation not in accordance with the principles laid down in this Declaration should not be accepted for publication.
9. In any research on human beings, each potential subject must be adequately informed of the aims, methods, anticipated benefits and potential hazard of the study and the discomfort it may entail. He or she should be informed that he or she is at liberty to abstain from participation in the study and that he or she is free to withdraw his or her consent to participation at any time. The physician should then obtain the subject's freely-given informed consent, preferably in writing.
10. When obtaining informed consent for the research project the physician should be particularly cautious if the subject is in a dependent relationship to him or her or may consent under duress. In that case the informed consent should be obtained by a physician who is not engaged in the investigation and who is completely independent of this official relationship.
11. In case of legal incompetence, informed consent should be obtained from the legal guardian in accordance with national legislation. Where physical or mental incapacity makes it impossible to obtain informed consent, or when the subject is a minor, permission from the responsible relative replaces that of the subject in accordance with national legislation. Whenever the minor child is in fact able to give a consent, the minor's consent must be obtained in addition to the consent of the minor's legal guardian.
12. The research protocol should always contain a statement of the ethical considerations involved and should indicate that the principles enunciated in the present Declaration are complied with.

9550089

Cont'd Encl. 12

II. MEDICAL RESEARCH COMBINED WITH PROFESSIONAL CARE
(Clinical research)

1. In the treatment of the sick person, the physician must be free to use a new diagnostic and therapeutic measure, if in his or her judgement it offers hope of saving life, reestablishing health or alleviating suffering.
2. The potential benefits, hazards and discomfort of a new method should be weighed against the advantages of the best current diagnostic and therapeutic methods.
3. In any medical study, every patient - including those of a control group, if any - should be assured of the best proven diagnostic and therapeutic method.
4. The refusal of the patient of participate in a study must never interfere with the physician-patient relationship.
5. If the physician considers it essential not to obtain informed consent, the specific reasons for this proposal should be stated in the experimental protocol for transmission to the independent committee (1, 2).
6. The physician can combine medical research with professional care, the objective being the acquisition of new medical knowledge, only to the extent that medical research is justified by its potential diagnostic or therapeutic value for the patient.

III. NON-THERAPEUTIC BIOMEDICAL RESEARCH INVOLVING HUMAN SUBJECTS (Non-clinical biomedical research)

1. In the purely scientific application of medical research carried out on a human being, it is the duty of the physician to remain the protector of the life and health of that person on whom biomedical research is being carried out.
2. The subjects should be volunteers - either healthy persons or patients for whom the experimental design is not related to the patient's illness.
3. The investigator or the investigating team should discontinue the research if in his/her or their judgement it may, if continued, be harmful to the individual.
4. In research on man, the interest of science and society should never take precedence over considerations related to the wellbeing of the subject.

MONTGOMERY ASBERG DEPRESSION RATING SCALE (MADRS)

I. Apparent sadness

Representing despondency, gloom and despair, (more than just ordinary transient low spirits) reflected in speech, facial expression, and posture. Rate by depth and inability to brighten up.

- 0 - No sadness.
- 1 -
- 2 - Looks dispirited but does brighten up without difficulty.
- 3 -
- 4 - Appears sad and unhappy most of the time.
- 5 -
- 6 - Looks miserable all the time. Extremely despondent.

II. Reported sadness

Representing reports of depressed mood, regardless of whether it is reflected in appearance or not. Includes low spirits, despondency or the feeling of being beyond help and without hope.

- Rate according to intensity, duration and the extent to which the mood is reported to be influenced by events.
- 0 - Occasional sadness in keeping with the circumstances.
 - 1 -
 - 2 - Sad or low but brightens up without difficulty.
 - 3 -
 - 4 - Pervasive feelings of sadness or gloominess. The mood is still influenced by external circumstances.
 - 5 -
 - 6 - Continuous or unvarying sadness, misery or despondency.

III. Inner tension

Representing feelings of ill-defined discomfort, edginess, inner turmoil, mental tension mounting to either panic, dread or anguish. Rate according to intensity, frequency, duration and the extent of reassurance called for.

- 0 - Placid. Only fleeting inner tension.
- 1 -
- 2 - Occasional feelings of edginess and ill-defined discomfort.
- 3 -
- 4 - Continuous feelings of inner tension or intermittent panic which the patient can only master with some difficulty.
- 5 -
- 6 - Unrelenting dread or anguish. Overwhelming panic.

IV. Reduced sleep

Representing the experience of reduced duration or depth of sleep compared to the subject's own normal pattern when well.

- 0 - Sleeps as usual.
- 1 -
- 2 - Slight difficulty dropping off to sleep or slightly reduced, light or fitful sleep.
- 3 -
- 4 - Sleep reduced or broken by at least two hours.
- 5 -
- 6 - Less than two or three hours sleep

V. Reduced appetite

Representing the feeling of a loss of appetite compared with when well. Rate by loss of desire for food or the need to be persuaded oneself to eat.

- 0 - Normal or increased appetite.
- 1 -
- 2 - Slightly reduced appetite.
- 3 -
- 4 - No appetite. Food is tasteless.
- 5 -
- 6 - Needs persuasion to eat at all.

Investigator's signature _____

- ♦ The present form, duly filled out, should be kept as record by the investigator, together with his/her copy of CRFs.
- ♦ A photocopy of the present form should be given to the monitor of Farmitalia Carlo Erba together with the unused drug at the end of the study.

**STATEMENT OF INVESTIGATOR FOR REBOXETINE CLINICAL STUDIES
PROTOCOL N° 20124/035**

1. Name and address of investigator:

2. Education, training and experience that qualifies the investigator as an expert in the clinical investigation of the drug for the use under investigation. Attached is the Curriculum Vitae.

3. Name and address of medical school, hospital or other research facility where the clinical investigation will be conducted:

4. Name and address of clinical laboratory facilities to be used in the study. Mark "x" in appropriate box:

 Same as the above mentioned Institution (no other clinical laboratory facilities will be used during the study)

 Other, specify (name and address):

5. Name and address of the Ethical Committee approval that is responsible for approval of the study:

 Same as the above mentioned Institution

 Other, specify:

9550089

Encl. 18 cont'd

Page 2 of 3

6. Names of the co-investigators (e.g. research fellows, residents, associates) who will be assisting the investigator in the conduct of the investigation:

1. _____
2. _____
3. _____
4. _____

7. Commitments

I agree to conduct the study in accordance with the current protocol and will only make changes in the protocol after notifying the sponsor, except when necessary to protect the safety, the rights, or welfare of subjects.

I agree to conduct the study in accordance with Good Clinical Practice (GCP) requirements.

I agree to personally conduct or supervise the described investigation.

I agree to inform patients that the drugs are being used for investigational purposes and I will ensure that the requirements relating to obtaining informed consent are met.

I agree to report to the sponsor adverse experiences that occur in the course of the investigation.

I have read and understand the information in the investigator's brochure, including the potential risks and side effects of the drugs.

I agree to ensure that all associates, colleagues and employees assisting in the conduct of the study are informed about their obligations in meeting the above commitments.

I agree to maintain adequate and accurate records and to make those records available for inspection.

9550089
Bl 18 cont'd

Page 3 of 3

I will not make any changes in the research without Ethical Committee approval, except where necessary to eliminate apparent immediate hazards to human subjects.

I agree to comply with all other requirements regarding the obligations of clinical investigators as per the declaration of Helsinki (and its modifications).

8. Signature of investigator

REBOXETINE PROTOCOL 20124/035: OPERATING PROCEDURES FOR STUDY MONITORING AND COORDINATION.

Aim

The purpose of these procedures is to provide standardization of the study conduct in the different clinical centers and to assure data uniformity and compatibility by appropriate interventions during data gathering.

Study monitoring

During the course of the study monthly monitoring visits will be conducted by Study Monitors from Farmitalia Carlo Erba.

The start-up visit will take place after approval of the protocol by the Institutional Review Board (IRB) or Ethical Committee. On this visit the following documents will be collected:

- copy of the protocol signed by the Principal Investigator;
- CV of Principal Investigator and Co-Investigators;
- the written approval of the study (typed on the Institute's letter head) by the Hospital or University Center Review Board and the IRB members list;
- an IRB approved blank copy of the consent form;
- the list of the laboratory normal values or ranges of the lab. tests.

These documents will be sent to FICE-Milan. On the occasion of this visit the monitor will also check that the CRFs and the drug supply have been delivered to the Clinical Investigator and the accompanying letter, signed by the Clinical Investigator, will be collected. In addition the Monitor will identify the staff members who will be involved in the study conduct and the monitoring visits schedule will be agreed.

9550089

Prot. 20124/035 Cont. Attachment A

The first monitoring visit will be done immediately after the recruitment of the first two, three patients.

The periodic monitoring visits are carried out in order to:

- 1 verify protocol adherence: patient eligibility, times of assessments, completeness of data, drug count;
- 2 verify data consistency looking for inconsistencies or errors in the data recorded on the CRF;
- 3 verify the accuracy of data collection in CRFs against the original clinic or hospital records for:
 - patient's initials and hospital record N°
 - signed informed consent
 - study medication administration and concomitant medications
 - physician notes on adverse events
 - 20% of data for laboratory tests, patient history and vital signs; in case of an error rate > 15% all data need to be monitored;
 - total Hamilton score reported in the hospital record.

Source-verified data can be initialled by the study monitor in the CRF.

- 4 review all adverse events including laboratory abnormalities, occurred since the previous visit. Should the information of a serious, or unexpected adverse event newly emerge, the local study Monitor must immediately (within two working days) inform the Product Leader in Milan;
- 5 evaluate patient recruitment rate and treatment discontinuations;
- 6 verify study medication storage and accountability and collect bottles of completed treatments;
- 7 ensure continued acceptability of the facilities and of the staff.

CRFs will be completed in black ink and corrections, if needed, made only by the Clinical Investigator with a single line throughout; the corrections will be initialled by Clinical Investigator and dated. Each page of each completed CRF will be signed by Clinical Investigator.

9550089

Prot. 20124/035 Cont. Attachment 035

After review for accuracy and completeness, the original and first copy of each page of the CRF will be removed (leaving the second copy with the Investigator). The first copy will be sent to Milan by Special Delivery Service for review and data processing while the original will be retained by the Monitor in the subsidiary until completion of the whole treatment period of the individual patient.

After each monitoring visit the periodic site visit report and the patient's progress report form will be filled in. Copy of them will be sent to FICE Milan.

The study termination visit will be performed upon Investigator's completion of all CRFs of treated patients. During this visit:

- 1 the monitor will check and collect the remaining completed CRFs and will perform a final data review;
- 2 a final check and review of drug accounting, inventorying of remaining drug supplies and arrangement to send them to FICE will be done;
- 3 a time frame for study reporting will be discussed;
- 4 appropriate follow-up of patients under long-term treatment will be assured and monitoring and collection of data from these patients discussed and agreed

The study termination visit form will be filled in and copy of it sent to FICE Milan.

Study coordination

In order to obtain uniformity and standardization in the carrying out of the study a Steering Committee is established. All questions arising during the conduct of the study will be submitted to the Committee for advice and action taking.

In particular the Committee will take care of:

- queries about patients acceptability
- possible need of protocol amendments
- possible need of premature termination of the study
- acceptability of particular cases of protocol violations
- evaluation of clinically relevant adverse events and their scientific and ethical consequences in terms of issues raised or study discontinuation.

9550089

Prot 20124/035 Cont Attachment A

Members of the Committee will be: Prof. T. Ban.

Any problem or issue arising during the conduct of the study will be submitted to the Committee in writing by the Clinical Investigators or by the study Monitors. "Ad hoc" meetings of the Committee will be organized when needed. File note of the meeting with conclusions about action taking will be circulated to Clinical Investigators and study Monitors.

**12.1.3 ETHICS COMMITTEES OR INVESTIGATIONAL REVIEW BOARDS:
APPROVALS, LIST OF MEMBERS, PATIENT INFORMATION AND
CONSENT FORMS**

Investigational Review Boards and Ethics Committees approvals were obtained according to local regulations and laws: copy of the approval documents and of Ethics Committees, list of members are filed in the Study Master File. The copy of Ethics Committee approval for center 48 (Melbourne-Australia) is not filed in the Study Master File as the original has been lost at the centre.

The proposed consent form is enclosed (Enclosure 5 of Appendix 12.1.1). Copy of forms approved by Ethics Committees and local translations are filed in the Study Master File.

 FARMITALIA CARLO ERBA

DATA September 10th, 1993

CERTIFICATE OF ANALYSIS No. PC/171

Imipramine hydrochloride 50 mg capsules

Batch A27G02

Manufacturing date : July, 1993
Expiry date : April, 1998
Description : hard-gelatin capsule, swedish orange opaque,
size No.0, containing two 25 mg TOFRANIL
sugar coated, dark pink orange, tablets
(GEIGY, batch No. H007)
Average weight : mg 152.04
Uniformity of mass : complies, according to Eur. Ph., 2nd Ed.,
requirements
Disintegration time : 10 minutes
Identification : positive, according to B.P. 1988
monograph texts A, B and C, page 956
Assay : 49.55 mg/capsule (B.P. 1988 monograph,
page 956)
Related substances : within the limits, according to B.P.1988
monograph, page 956
Microbial contamination : total viable aerobic count < 1000
moulds and yeasts < 100
E.coli and Salmonellae : absent
Approved by : V. Busnelli *Busnelli*

12.1.11 SELECTION OF STATISTICAL ANALYSIS OUTPUTS

9550089

**PHARMACIA CNS R&D
REBOXETINE - PROTOCOL 20124/035**

Appendix No.: 12.1.11

SELECTION OF STATISTICAL ANALYSIS OUTPUTS

Study end-point: Odds of experiencing at least one adverse event

The following analyses have been carried out on study end-point and on events and cluster of events of particular relevance in terms of frequency:

- Adjusted odds ratio (95% CI) by Mantel-Haenszel method using diagnosis as strata
- Breslow-Day test for homogeneity across strata

The following analyses have been carried out both for the total patient sample, and for each subgroup identified by the stratification factor, i.e. patients with Major Depressive Episode/Disorder and Dysthymia.

Efficacy analyses

HAMD decrease at last assessment

- Tables showing descriptive statistics (n, mean, standard deviation SD)
- Between treatment difference and 95% confidence interval

CGI at last assessment

- Difference between frequency of much and very much improved in the two treatment groups and 95% confidence interval

Analysis of Adverse Events

- Long-rank test on the time to the first occurrence of selected signs-symptoms for the comparisons between the two active treatments.

Pharmacia

Document 9550089

Narrative of Event No. BE 0047 Protocol No. 20124/ 035 Patient No. 1

Center: Gent (Belgium)

Investigator: Van Moffaert

Adverse event: meningioma (operated) (date of the event: 12 November 1992)

Patient's history: the patient was a 83 year old female and was suffering from a Major Depressive Episode for 3 months when she entered the Study 20124/035 on 23 October 1992. She had had the onset of depressive disorder at the age of 83 years.

The patient had undergone an hysterectomy. She had been suffering from paresis in both legs since 25 April 1992 and hypertension. She was on treatment with bisoprolol fumarate and temazepam.

Baseline ECG and chest X-ray were normal.

Experimental period: the patient entered the 20124/035 study on 23 October 1992 and received the experimental treatment as follows:

Treatment		Days	Dose (mg/day)	Remarks
From	To			
30 October 1992	9 November 1992	11	4	
10 November 1992	10 November 1992	1	2	

On 9 November 1992 the patient developed an urinary retention and on 10 November 1992 there was a neurological worsening of her paresis resulting in an almost complete paralysis of both legs. A Neutron Magnetic Resonance (NMR) test was performed and a mass in the brain was detected. The experimental treatment was definitively discontinued.

On 14 November 1992 the patient was operated to remove this mass. The biopsy was performed and it was found to be a psammomatous meningioma. After the surgery she remained in the hospital till 14 January 1993 for full recovery.

During the study the patient had received the experimental treatment for 12 days and she had received a cumulative amount of 46 mg of reboxetine.

Comments: the Investigator judged the adverse event as not drug related.

Center: Hull (United Kingdom)

Investigator: Mullin

Adverse event: acute confusional state and fall (date of the event: 11 December 1993)

Patient's history: the patient was a 78 year old female and was suffering from a Major Depressive Episode for 3 months when she entered the Study 20124/035 on 3 December 1993. She had had the onset of depressive disorder at the age of 74 years.

The patient been suffering from angina pectoris, severe scoliosis of dorsal spine and arthritis of both hips. She was on treatment with glyceryl trinitrate.

Baseline ECG was normal.

Experimental period: the patient entered Study 20124/035 on 3 December 1993 and received the experimental treatment as follows:

Treatment		Days	Dose (mg/day)	Remarks
From	To			
8 December 1993	10 December 1993	3	4	
11 December 1993	11 December 1993	1	2	

On 11 December 1993 the patient complained of acute confusional state and during the same day she fell reporting the fracture of some ribs. On chest X-ray a suspicious mass, probably cancer of bronchus, was detected. The experimental treatment was definitively discontinued.

At the moment of the event the patient had been under the experimental treatment for 4 days and she had received a cumulative amount of 14 mg of reboxetine, while being treated with 2 mg of the compound.

Comments: the Investigator judged the adverse event as possibly drug related.

PHARMACIA CNS R2D

REBOXETINE - PROTOCOL 20124/035
Listing No.: 3.0

- A. At least five of the following symptoms have been present during the same two-week period and represent a change from previous functioning: at least one of the symptoms is either 1) depressed mood or 2) loss of interest or pleasure.
- 1) depressed mood most of the day, nearly every day, as indicated by subjective account or observation by others
 - 2) markedly diminished interest or pleasure in all, or almost all, activities most of the day, nearly every day (as indicated either by subjective account or observation by others of apathy most of the time)
 - 3) significant weight loss or weight gain when not dieting (e.g. more than 5% of body weight in a month), or decrease or increase in appetite nearly every day
 - 4) insomnia or hypersomnia nearly every day
 - 5) psychomotor agitation or retardation nearly every day (observable by others, not merely subjective feelings of restlessness or being slowed down)
 - 6) fatigue or loss of energy nearly every day
 - 7) feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick)
 - 8) diminished ability to think or concentrate, or indecisiveness, nearly every day (either by subjective account or as observed by others)
 - 9) recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide
- B. 1) it cannot be established that an organic factor initiated and maintained the disturbance
2) the disturbance is not a normal reaction to the death of a loved one
- C. At no time during the disturbance have there been delusions or hallucinations for as long as two weeks in the absence of prominent mood symptoms (i.e., before the mood symptoms developed or after they have remitted)
- D. Not superimposed on Schizophrenia, Schizophreniform, Disorder, Delusional Disorder, or Psychotic Disorder NOS.

PHARMACIA CNS RSD

REBOXETINE - PROTOCOL 20124/035
Listing No.: 3.1

- A. Depressed mood for most of the day, more days than not, as indicated either by subjective account or observation by others, for at least two years.
- B. Presence, while depressed, of at least two of the following:
 - 1) poor appetite or overeating
 - 2) insomnia or hypersomnia
 - 3) low energy or fatigue
 - 4) low self-esteem
 - 5) poor concentration or difficulty making decisions
 - 6) feeling of hopelessness
- C. During a two-year period of the disturbance, never without the symptoms in A for more than two months at a time.
- D. No evidence of an unequivocal Major Depressive Episode during the first two years of the disturbance.
- E. Has never had a Manic Episode or an unequivocal Hypomanic Episode.
- F. Not superimposed on a chronic psychotic disorder, such as Schizophrenia or Delusional Disorder.
- G. It cannot be established that an organic factor initiated and maintained the disturbance, e.g., prolonged administration of an antihypertensive medication.
